Great, thanks for the update. Did Agusta review the variance language?

I gave it Bryan yesterday morning. I haven't received any comments from Bheem so I don't know where it is in his queue.

Heh, that went out quite awhile ago and a response is already in! We just didn't get copied. Camille is working on the permit today. b2

Have you sent an email to Eglin yet on the variance addendum?

Informal is definitely the way to go, and lets limit the message to what Eglin needs to provide. We need to get the information to Eglin quickly so they can respond accordingly and get this permit moving.

Thanks,

I agree about keeping this informal. Camille, let's discuss when you get back on Tues. B2

I thought we would take a more informal approach: just an e-mail to Robin, with a suggestion to update the variance request. Is there some reason we want to address this to the commanding officer?

Also, the latest version of the language I proposed to send to Robin is attached. This is based on Bryan's e-mail of 3/3/04 4:05 pm:

I believe we were referring to a 10x factor for the gw protection level, not a straight 10ppb. That would make the amino-dinitrotoluenes 4ppb and 2,4-DNT 0.6ppb. From what I've been able to find out, DNT should be relatively stable once it hits groundwater. It does not hydrolyze. So, only dilution/dispersion will reduce the concentrations. And the concentrations for both hovered very near the normal protection limits.

Please review the attached document.

Is there anyone else to whom I should send this letter for review before finalizing it?

Thank you.

That is all.
