Re: 1998 Third Quarter Monitoring Report
Safety-Kleen Systems, Inc., Manhattan Avenue, Tampa Facility
Closure Permit No. HF29-158003
EPA ID No. FLD 049 557 408

Dear Hazardous Waste Supervisor:

On behalf of Safety-Kleen, Environmental Consulting & Technology, Inc. (ECT) herein submits results of the August 1998 quarterly ground water monitoring pursuant to Specific Conditions (S.C.) IV.4 and IV.11 of the referenced permit. In addition, limited ground water corrective actions were proactively conducted this quarter from June 25 through August; therefore, this document includes the quarterly ground water remedial system report pursuant to Specific Conditions IV.13 and IV.14.

QUARTERLY GROUND WATER MONITORING REPORT

Ground water samples and water level data were collected in August 1998 according to procedures described in the closure permit for the facility. The ground water samples were submitted to Analytical Services, Inc. (ASI) for analysis of the parameters listed in Specific Condition IV.3 of the closure permit as modified on August 7, 1996.

Ground water samples were collected from nine monitor wells in August 1998. Offsite monitor wells SA-3 and DA-4D were under water and could not be sampled. Monitor well sampling data forms are provided in Appendix A. Ground water levels and total well depths were measured at each well sampled. Ground water elevation data for August 12, 1998, are presented in Table 1, and a water table elevation contour map is shown in Figure 1. The water table elevations shown average approximately 3 ft higher than the May 1998 elevations. The inferred ground water flow direction is toward the east-northeast, consistent with historical data for nonpumping conditions.

The laboratory report of ground water quality analytical methods and results is presented as Appendix B. Table 2 provides a summary of all constituents detected in ground water. Concentration trends for select analytes are illustrated in Figure 2 for monitor well POC-2 and Figure 3 for monitor well POC-3. Well locations are shown in Figure 1.

Several organic constituents were detected in low concentrations at monitor well POC-3, yet only one slightly exceeded a health-based standard listed in the draft renewal permit; naphthalene (33 µg/L) exceeded its standard of 28 µg/L. Xylenes (41 µg/L) at POC-3 exceeded its secondary standard of 20 µg/L. Monitor well POC-2 has not exceeded any

ground water standard since November 1996. Period of record trends show that all constituent concentrations have decreased significantly at these wells (Figures 2 and 3). The observed decreases are likely the result of ground water recovery and the treatment system adjustments previously reported.

As usual, concentrations of metals were generally below detection limits or very low. Metals are clearly not a problem at this facility.

GROUND WATER REMEDIATION SYSTEM REPORT

Specific Condition IV.13 of the closure permit requires quarterly reporting on the effectiveness of the ground water recovery and treatment systems. The specific items that must be included in the ground water remediation system report are outlined in Specific Condition IV.14. Each of these items, "a" through "l", is reprinted below and followed by pertinent information.

Item a. A narrative summary on the effectiveness of the treatment and recovery system.

The soil vapor and ground water recovery and treatment systems began continuous, automated operation in late January 1994. The following discussion provides a summary of the effectiveness of the soil and ground water remediation systems.

The ground water remediation system had undergone extensive and rigorous startup testing. As discussed in the November 1993 quarterly report, the objectives of the Phase 1 and Phase 2 startup testing were achieved in January, 1994. As such, Phase 3 operation was initiated in late January, 1994. The Phase 3 sampling program (now quarterly) includes influent and intercarbon sample analyses for the eight RCRA metals and volatile organic compounds by EPA Methods 8010/8020. This report includes results of the monitoring program for August 1998 (Appendix C).

The ground water remediation system is effectively capturing the contaminant plume (see Items i and k) and completely treating the impacted ground water (see Item g and Table 3). The ground water system has recovered and treated approximately 5,957,580 gallons of water. Ground water constituent concentrations have been reduced dramatically. In addition, an air sparging system was installed in November 1996 and became operational on December 16, 1996 (see Item b). This system was added to accelerate site cleanup, and current data suggest the air sparging system is highly effective.

As described in item b.4. (below), and as previously reported, the ground water and soil remediation systems were deactivated on May 23, 1997, in accordance with S.C.IV.10 and X.3. On December 30, 1997, limited ground water corrective actions (pumping POC-3 and air sparging at SP-1 and SP-2) were proactively reinitiated. This quarter, ground water recovery at POC-3 was initiated on a continuous basis from June 25 through August 1998.

The soil vapor extraction (SVE) system had been operating from January 24, 1994 to May 23, 1997. Rainy seasons had resulted in periods when the SVE system could not operate due to high water levels. Soil compaction had also hindered operation of the SVE system. An SVE well point pilot test was initiated in October, 1995 and is described in

Item 1. Results showed significant reductions in soil vapor concentrations. Organic compound removal efficiency in the recovered soil vapor air stream ranged from 99.4 percent to greater than 99.9 percent. The SVE system is no longer in operation.

Item b. Any minor revisions or adjustments to the treatment and recovery system or plan.

The following adjustments have been made:

1. To maximize effectiveness and efficiency of ground water cleanup, on February 9, 1995, wells POC-2 and POC-3 were equipped to serve as temporary recovery wells and supplement pumpage from recovery wells RW-1 and RW-2, as previously reported. Drop pipes were installed in POC-2 and POC-3 and connected to a common header. Water is pumped from these wells via a diaphragm suction pump into the oil/water separator, then treated as usual.
2. Temporary SVE well points were installed and testing initiated in October 1995 (see Item 1). The original SVE system blower was removed and a mobile blower was subsequently used.
3. In November 1996, two air sparging points were added to the system to accelerate site cleanup. As agreed with FDEM on October 1, 1996, this adjustment is an interim measure and does not require a permit modification. Air sparging point SP-2 is located approximately 9 ft west-southwest of monitor well POC-2, and SP-1 is located approximately 17 ft west of POC-3. The sparge point construction logs were provided in the January 29, 1997 quarterly report. After installation of the air compressor, operation of the air sparging system began on December 16, 1996. Subsequent data suggest that the air sparging system is significantly enhancing the ground water cleanup efforts.
4. As previously reported, the ground water and soil remediation systems were deactivated on May 23, 1997, in accordance with S.C.IV.10 and X.3. On December 30, 1997, limited ground water corrective actions (pumping POC-3 and air sparging at SP-1 and SP-2) were proactively reinitiated on a continuous basis.

Item c. Any proposed modification to the treatment and recovery system.

No modifications are proposed at this time.

Item d. Complete inspection logs for previous three months. These logs must include inspections of the recovery well pump(s) and treatment systems.

Operation and maintenance logs are provided in Appendix D.

Item e. Record of when the treatment system is operating.

The ground water treatment system is designed to shut off automatically by a high-level switch in the oil/water separator, and by a high-level switch in the infiltration gallery. The infiltration gallery high-level switch shut off is equipped with a timer set at 5 hours. This timer affects automatic restart of the system, unless water levels have not receded to below

the cut off level. Automated operation was continuous throughout this quarter from June 25 through August 31, 1998. Approximately 108,368 gallons of water from POC-3 were recovered and treated this quarter.

Item f. Total volume of processed ground water.

As of August 31, 1998, a grand total of approximately 5,957,580 gallons of ground water had been recovered and treated; this also includes water treated during the Phase 1 and Phase 2 startup testing program.

Item g. Summary of influent/effluent data, chain-of-custodies, and lab reports.

Appendix C is comprised of chain-of-custodies and lab reports pertaining to the ground water remediation system for August, 1998. Influent and effluent analytical data for ground water are summarized in Table 3.

Item h. Summary of ground water data (including graphical representation) with emphasis on the most common contaminants and those most difficult to treat.

Period of record ground water quality data for monitor wells POC-2 and POC-3 are presented in Figures 2 and 3, respectively. These are the only two wells at the site that historically indicated ground water impacts. The figures provide graphs of concentrations through time for the following analytes: benzene, chlorobenzene, ethylbenzene, xylenes and naphthalene. The long term trend is toward decreasing concentrations for all constituents. These trends are further discussed in the Quarterly Ground Water Monitoring Report section of this document.

Item i. Ground water elevation contour maps for previous six months.

Ground water elevation contour maps are provided for March 25, 1998 (Figure 4); May 27, 1998 (Figure 5); and August 12, 1998 (Figure 1).

Item j. Record of repairs (wells, piping, etc.).

- The ground water system totalizing flow meter was previously replaced. The grand total flow volume is now calculated as the direct reading from the existing meter plus 4,178,000 gallons (from previous meters).
- Chlorine and bromine tablets were added to the oil/water separator to reduce biofouling of the ground water treatment system.
- Water filters were replaced, as necessary.

Item k. Figure depicting the zone of capture of the recovery wells including delineation of stagnation points.

Pursuant to Specific Condition IV.12 of the closure permit, water table elevation contour maps are presented in Figures 4, 5 and 1. These maps depict water table elevations in March, May, and August, 1998, as indicated in Item i. While pumping POC-3, the capture zone appears to fully envelope the limited area of ground water impacts.

October 26, 1998

Page 5

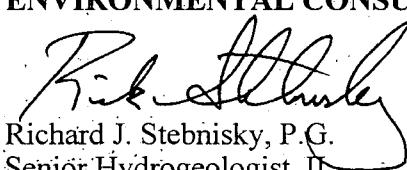

Item I. Soil venting data.

Not applicable.

If you have any questions or comments regarding this quarterly monitoring report, please contact me at (813) 289-9338 or Gary Rissee of Safety-Kleen at (770) 418-1860. Thank you.

Sincerely,

ENVIRONMENTAL CONSULTING & TECHNOLOGY, INC.

TABLES

Table 1. Water Table Elevations (August 12, 1998)
 Safety-Kleen Corp.
 Manhattan Avenue Facility, Tampa, Florida

Well No.	MP Elevation (ft-msl)	Depth to Water (ft)	Water Table Elevation (ft-msl)
POC-1	32.80	4.54	28.26
POC-2	32.77	4.59	28.18
POC-3	31.84	3.83	28.01
SA-1	28.29	0.41	27.88
SA-2	29.72	1.68	28.04
SA-3	27.49	NM	NA
SA-4	30.05	1.58	28.47
BG-1	32.83	4.24	28.59
DA-1A*	30.90	3.95	26.95
DA-4D*	27.55	NM	NA
DA-5D*	29.70	6.69	23.01

Notes: MP = Measuring point.
 ft-msl = Feet above mean sea level.
 NM = Not measured - underwater.
 NA = Not applicable.
 MPs for POC-2 and POC-3 are for nonpumping conditions.
 MP for DA-1A is approximate (to ~0.1 ft).
 * = Not a water table monitor well, a deeper well.

 µg/L = Micrograms per liter.
 * = Air stripper blower not on.
 -- = Not analyzed.

Ground Water System Sample Locations

- Influent (from oil/water separator, except April and May, 1995, from transfer tank).
- Intercarbon (from port between the two sets of carbon drums).
- Effluent (from port after the second set of carbon drums).

Source: ECT, 1998.

Report No. 98674-2

Sample Description

Water, grab, SK-Tampa (Manhattan Ave), Project #98033-1111, Intercarbon, 08/24/98, 15:25, received 08/25/98

RESULTS

	Result (mg/l)	Detection Limit (mg/l)
<u>Metals</u>		
Total Arsenic (As) (EPA 6010).....	BDL	0.005
Total Barium (Ba) (EPA 6010).....	0.009	0.001
Total Cadmium (Cd) (EPA 6010).....	BDL	0.001
Total Chromium (Cr) (EPA 6010).....	BDL	0.001
Total Lead (Pb) (EPA 6010).....	BDL	0.004
Total Mercury (Hg) (EPA 7470).....	BDL	0.0002
Total Selenium (Se) (EPA 6010).....	BDL	0.006
Total Silver (Ag) (EPA 6010).....	BDL	0.0009
<u>BTEX (EPA 8021B)</u>	<u>(ug/l)</u>	<u>(ug/l)</u>
Benzene.....	BDL	0.26
Ethylbenzene.....	BDL	0.24
Toluene.....	BDL	0.48
Xylenes.....	BDL	0.82
<u>Halogenated Volatile Organics (EPA 8021B)</u>	<u>(ug/l)</u>	<u>(ug/l)</u>
Benzyl chloride.....	BDL	0.84
Bromobenzene.....	BDL	0.50
Bromodichloromethane.....	BDL	0.50
Bromoform.....	BDL	0.50
Bromomethane.....	BDL	0.97

Re: 1998 Second Quarter Monitoring Report
Safety-Kleen Corp., Manhattan Avenue, Tampa Facility
Closure Permit No. HF29-158003
EPA ID No. FLD 049 557 408

Dear Hazardous Waste Supervisor:

On behalf of Safety-Kleen Corp., Environmental Consulting & Technology, Inc. (ECT) herein submits results of the May 1998 quarterly ground water monitoring pursuant to Specific Conditions (S.C.) IV.4 and IV.11 of the referenced permit. In addition, limited ground water corrective actions were proactively conducted this quarter in March and April; therefore, this document includes the quarterly ground water remedial system report pursuant to Specific Conditions IV.13 and IV.14.

Safety-Kleen continues to await issuance of the renewal permit; the permit application was submitted on March 27, 1997. Safety-Kleen also awaits Department approval to implement the March 1997 soil sampling plan to document clean closure of the soil.

QUARTERLY GROUND WATER MONITORING REPORT

Ground water samples and water level data were collected in May 1998 according to procedures described in the closure permit for the facility. The ground water samples were submitted to Analytical Services, Inc. (ASI) for analysis of the parameters listed in Specific Condition IV.3 of the closure permit as modified on August 7, 1996.

Ground water samples were collected from all eleven monitor wells in May 1998. Monitor well sampling data forms are provided in Appendix A. Ground water levels and total well depths were measured at each well sampled. Ground water elevation data for May 27, 1998, are presented in Table 1, and a water table elevation contour map is shown in Figure 1. The water table elevations shown average approximately 3.5 ft lower than the February 1998 elevations. The inferred ground water flow direction is toward the east-northeast, consistent with historical data for nonpumping conditions.

The laboratory report of ground water quality analytical methods and results is presented as Appendix B. Table 2 provides a summary of all constituents detected in ground water. Concentration trends for select analytes are illustrated in Figure 2 for monitor well POC-2 and Figure 3 for monitor-well POC-3. Well locations are shown in Figure 1.

Several organic constituents were detected in low concentrations at monitor well POC-3, yet only one exceeded a health-based standard listed in the draft permit; benzene (1.3 µg/L) exceeded its standard of 1 µg/L. Monitor well POC-2 has not exceeded any ground water

Page 2

standard since November 1996. Period of record trends show that all constituent concentrations have decreased significantly at these wells (Figures 2 and 3). The observed decreases are likely the result of ground water recovery and the treatment system adjustments previously reported. However, POC-3 showed increased concentrations for several constituents last quarter. That was probably due to a temporary remobilization of previously sorbed organics, as a result of the excessive winter rains and the physical agitation of the reinitiated ground water corrective actions (pumping at POC-3 and air sparging at SP-1 and SP-2). Concentrations decreased at POC-3 this quarter.

As usual, concentrations of metals were generally below detection limits or very low. Metals are clearly not a problem at this facility.

GROUND WATER REMEDIATION SYSTEM REPORT

Specific Condition IV.13 of the closure permit requires quarterly reporting on the effectiveness of the ground water recovery and treatment systems. The specific items that must be included in the ground water remediation system report are outlined in Specific Condition IV.14. Each of these items, "a" through "l", is reprinted below and followed by pertinent information.

Item a. A narrative summary on the effectiveness of the treatment and recovery system.

The soil vapor and ground water recovery and treatment systems began continuous, automated operation in late January 1994. The following discussion provides a summary of the effectiveness of the soil and ground water remediation systems.

The ground water remediation system had undergone extensive and rigorous startup testing. As discussed in the November 1993 quarterly report, the objectives of the Phase 1 and Phase 2 startup testing were achieved in January, 1994. As such, Phase 3 operation was initiated in late January, 1994. The Phase 3 sampling program (now quarterly) includes influent and intercarbon sample analyses for the eight RCRA metals and volatile organic compounds by EPA Methods 8010/8020. This report includes results of the monitoring program for March 1998 (Appendix C).

The ground water remediation system is effectively capturing the contaminant plume (see Items i and k) and completely treating the impacted ground water (see Item g and Table 3). The ground water system has recovered and treated approximately 5,849,212 gallons of water. Ground water constituent concentrations have been reduced dramatically. In addition, an air sparging system was installed in November 1996 and became operational on December 16, 1996 (see Item b). This system was added to accelerate site cleanup, and current data suggest the air sparging system is highly effective.

As described in item b.4. (below), and as previously reported, the ground water and soil remediation systems were deactivated on May 23, 1997, in accordance with S.C.IV.10 and X.3. On December 30, 1997, limited ground water corrective actions (pumping POC-3 and air sparging at SP-1 and SP-2) were proactively reinitiated on a continuous basis through April 1998.

The soil vapor extraction (SVE) system had been operating from January 24, 1994 to May 23, 1997. Rainy seasons had resulted in periods when the SVE system could not operate due to high water levels. Soil compaction had also hindered operation of the SVE system. An SVE well point pilot test was initiated in October, 1995 and is described in Item 1. Results showed significant reductions in soil vapor concentrations. Organic compound removal efficiency in the recovered soil vapor air stream ranged from 99.4 percent to greater than 99.9 percent. The SVE system is no longer in operation.

Item b. Any minor revisions or adjustments to the treatment and recovery system or plan.

The following adjustments have been made:

1. To maximize effectiveness and efficiency of ground water cleanup, on February 9, 1995, wells POC-2 and POC-3 were equipped to serve as temporary recovery wells and supplement pumpage from recovery wells RW-1 and RW-2, as previously reported. Drop pipes were installed in POC-2 and POC-3 and connected to a common header. Water is pumped from these wells via a diaphragm suction pump into the oil/water separator, then treated as usual.
2. Temporary SVE well points were installed and testing initiated in October 1995 (see Item 1). The original SVE system blower was removed and a mobile blower was subsequently used.
3. In November 1996, two air sparging points were added to the system to accelerate site cleanup. As agreed with FDEM on October 1, 1996, this adjustment is an interim measure and does not require a permit modification. Air sparging point SP-2 is located approximately 9 ft west-southwest of monitor well POC-2, and SP-1 is located approximately 17 ft west of POC-3. The sparge point construction logs were provided in the January 29, 1997 quarterly report. After installation of the air compressor, operation of the air sparging system began on December 16, 1996. Subsequent data suggest that the air sparging system is significantly enhancing the ground water cleanup efforts.
4. As previously reported, the ground water and soil remediation systems were deactivated on May 23, 1997, in accordance with S.C.IV.10 and X.3. On December 30, 1997, limited ground water corrective actions (pumping POC-3 and air sparging at SP-1 and SP-2) were proactively reinitiated on a continuous basis through April 1998.

Item c. Any proposed modification to the treatment and recovery system.

No modifications are proposed at this time.

Item d. Complete inspection logs for previous three months. These logs must include inspections of the recovery well pump(s) and treatment systems.

Operation and maintenance logs are provided in Appendix D.

Item e. Record of when the treatment system is operating.

The ground water treatment system is designed to shut off automatically by a high-level switch in the oil/water separator, and by a high-level switch in the infiltration gallery. The infiltration gallery high-level switch shut off is equipped with a timer set at 5 hours. This timer affects automatic restart of the system, unless water levels have not receded to below the cut off level. Automated operation was continuous throughout March and April this quarter. Approximately 195,212 gallons of water from POC-3 were recovered and treated this quarter.

Item f. Total volume of processed ground water.

As of June 25, 1998, a grand total of approximately 5,849,212 gallons of ground water had been recovered and treated; this also includes water treated during the Phase 1 and Phase 2 startup testing program.

Item g. Summary of influent/effluent data, chain-of-custodies, and lab reports.

Appendix C is comprised of chain-of-custodies and lab reports pertaining to the ground water remediation system for March, 1998. Influent and effluent analytical data for ground water are summarized in Table 3.

Item h. Summary of ground water data (including graphical representation) with emphasis on the most common contaminants and those most difficult to treat.

Period of record ground water quality data for monitor wells POC-2 and POC-3 are presented in Figures 2 and 3, respectively. These are the only two wells at the site that historically indicated ground water impacts. The figures provide graphs of concentrations through time for the following analytes: benzene, chlorobenzene, ethylbenzene, xylenes and naphthalene. The long term trend is toward decreasing concentrations for all constituents. These trends are further discussed in the Quarterly Ground Water Monitoring Report section of this document.

Item i. Ground water elevation contour maps for previous six months.

Ground water elevation contour maps are provided for the following dates: February 24, 1998 (Figure 4); March 25, 1998 (Figure 5); and May 27, 1998 (Figure 1).

Item j. Record of repairs (wells, piping, etc.).

- The ground water system totalizing flow meter was previously replaced. The grand total flow volume is now calculated as the direct reading from the existing meter plus 4,178,000 gallons (from previous meters).
- Chlorine and bromine tablets were emplaced in the oil/water separator to reduce biofouling of the ground water treatment system.
- Water filters were replaced, as necessary.

Hazardous Waste Supervisor
July 20, 1998
Page 5

Item k. Figure depicting the zone of capture of the recovery wells including delineation of stagnation points.

Pursuant to Specific Condition IV.12 of the closure permit, water table elevation contour maps are presented in Figures 1, 4, and 5. These maps depict water table elevations in May, February and March, 1998, as indicated in Item i. While pumping POC-3, the capture zone appears to fully envelope the area of ground water impacts.

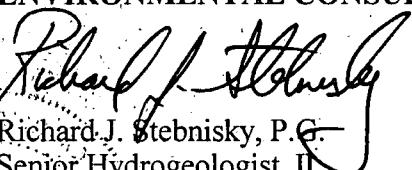

Item l. Soil venting data.

Not applicable.

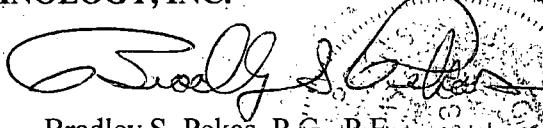

If you have any questions or comments regarding this quarterly monitoring report, please contact me at (813) 289-9338 or Gary Risse of Safety-Kleen at (770) 418-1860. Thank you.

Sincerely,

µg/L	=	Micrograms per liter.
*	=	Air stripper blower not on.
--	=	Not analyzed.

Ground Water System Sample Locations

- Influent (from oil/water separator, except April and May, 1995, from transfer tank).
- Intercarbon (from port between the two sets of carbon drums).
- Effluent (from port after the second set of carbon drums).

LABORATORY REPORT

Safety-Kleen Corporation
4800 S Old Peachtree Road
Norcross, GA 30071

June 17, 1998

P.O. No. E13353

Attention: Mr. Gary Risse

Report No. 95510-11

Sample Description

Water, SK-Tampa (Manhattan Ave), Project #98033-1111, DA-1A, 05/28/98,
11:30, received 05/29/98

RESULTS

	<u>Result</u>	<u>Detection Limit</u>
Total Sulfide (S) (mg/l) (SM 4500-S ²⁻ D)	BDL	0.2
<u>Metals</u>	<u>(mg/l)</u>	<u>(mg/l)</u>
Total Arsenic (As) (EPA 6010)	BDL	0.005
Total Barium (Ba) (EPA 6010)	0.01	0.001
Total Beryllium (Be) (EPA 6010)	BDL	0.0004
Total Cadmium (Cd) (EPA 6010)	BDL	0.001
Total Chromium (Cr) (EPA 6010)	BDL	0.001
Total Copper (Cu) (EPA 6010)	0.44	0.01
Total Lead (Pb) (EPA 6010)	BDL	0.004
Total Mercury (Hg) (EPA 7470)	BDL	0.0002
Total Nickel (Ni) (EPA 6010)	BDL	0.002
Total Silver (Ag) (EPA 6010)	BDL	0.0009
Total Zinc (Zn) (EPA 6010)	0.10	0.008
Total Vanadium (V) (EPA 6010)	0.008	0.002

REMEDIAL SYSTEM ANALYTICAL LABORATORY REPORTS

ANALYTICAL SERVICES, INC.

ENVIRONMENTAL MONITORING & LABORATORY ANALYSIS

110 TECHNOLOGY PARKWAY • NORCROSS, GA 30092
(770) 734-4200 • FAX (770) 734-4201

LABORATORY REPORT

Safety-Kleen Corporation
4800 S Old Peachtree Road
Norcross, GA 30071

April 22, 1998

Attention: Mr. Gary Risse

P.O. No. E13353

Report No. 93334-1

Sample Description

Groundwater, SK-Tampa (Manhattan Ave), Project #98033-1111,
Effluent 032598, 03/25/98, 07:45, received 03/27/98

RESULTS

Hold until further notice.

cc: Mr. Rick Stebnisky
ECT, Tampa

Respectfully submitted,

Shai Saifer
Project Manager

Christina Dryett

Re: 1998 First Quarter Monitoring Report
Safety-Kleen Corp., Manhattan Avenue, Tampa Facility
Closure Permit No. HF29-158003
EPA ID No. FLD 049 557 408

Dear Hazardous Waste Supervisor:

On behalf of Safety-Kleen Corp., Environmental Consulting & Technology, Inc. (ECT) herein submits results of the February 1998 quarterly ground water monitoring pursuant to Specific Conditions (S.C.) IV.4 and IV.11 of the referenced permit. In addition, limited ground water corrective actions were proactively conducted this quarter; therefore, this document includes the quarterly ground water remedial system report pursuant to Specific Conditions IV.13 and IV.14.

Safety-Kleen continues to wait for FDEP issuance of the renewal permit; the permit application was submitted on March 27, 1997. Safety-Kleen also awaits Department approval to implement the March 1997 soil sampling plan to document clean closure of the soil. Safety-Kleen wishes to proactively close this facility without further delays by FDEP.

QUARTERLY GROUND WATER MONITORING REPORT

Ground water samples and water level data were collected in February 1998 according to procedures described in the closure permit for the facility. The ground water samples were submitted to Analytical Services, Inc. (ASI) for analysis of the parameters listed in Specific Condition IV.3 of the closure permit as modified on August 7, 1996.

Ground water samples were collected from eight monitor wells in February 1998. As is commonly the case during wet periods, three monitor wells located offsite to the east (SA-3, SA-1, and DA-4D) were under water and could not be sampled. Monitor well sampling data forms are provided in Appendix A. Ground water levels and total well depths were measured at each well sampled. Ground water elevation data for February 24, 1998, are presented in Table 1, and a water table elevation contour map is shown in Figure 1. The

inferred ground water flow direction is toward the east, consistent with historical data for pumping conditions.

The laboratory report of ground water quality analytical methods and results is presented as Appendix B. Table 2 provides a summary of all constituents detected in ground water. Concentration trends for select analytes are illustrated in Figure 2 for monitor well POC-2 and Figure 3 for monitor well POC-3. Well locations are shown in Figure 1.

Several organic compounds were detected in low concentrations at monitor well POC-3, and three exceeded standards: naphthalene was detected at a concentration of 67 µg/L, which is above its organoleptic based ground water guidance concentration; total xylenes was detected at 58 µg/L, which is above its organoleptic based secondary drinking water standard; and benzene (1.9 µg/L) exceeded its primary drinking water standard of 1 µg/L. Monitor well POC-2 has not exceeded any ground water standard since November 1996. Period of record trends show that all constituent concentrations have decreased significantly at these wells (Figures 2 and 3). The observed decreases are likely the result of ground water recovery and the treatment system adjustments previously reported. However, POC-3 showed increased concentrations for several constituents this quarter. This may be due to a temporary remobilization of previously sorbed organics, as a result of the excessive rains this winter and the physical agitation of the reinitiated ground water corrective actions (pumping at POC-3 and air sparging at SP-1 and SP-2).

As usual, concentrations of metals were generally below detection limits or very low. Metals are clearly not a problem at this facility.

GROUND WATER REMEDIATION SYSTEM REPORT

Specific Condition IV.13 of the closure permit requires quarterly reporting on the effectiveness of the ground water recovery and treatment systems. The specific items that must be included in the ground water remediation system report are outlined in Specific Condition IV.14. Each of these items, "a" through "l", is reprinted below and followed by pertinent information.

Item a. A narrative summary on the effectiveness of the treatment and recovery system.

The soil vapor and ground water recovery and treatment systems began continuous, automated operation in late January 1994. The following discussion provides a summary of the effectiveness of the soil and ground water remediation systems.

The ground water remediation system had undergone extensive and rigorous startup testing. As discussed in the November 1993 quarterly report, the objectives of the Phase 1 and Phase 2 startup testing were achieved in January, 1994. As such, Phase 3 operation, which includes monthly monitoring, was initiated in late January, 1994. The Phase 3 monthly

sampling program includes influent and intercarbon sample analyses for the eight RCRA metals and volatile organic compounds by EPA Methods 8010/8020. This report includes results of the monthly monitoring program for December 1997, and January and February 1998 (Appendix C).

The ground water remediation system is effectively capturing the contaminant plume (see Items i and k) and completely treating the impacted ground water (see Item g and Table 3). The ground water system has recovered and treated approximately 5,654,000 gallons of water. Ground water constituent concentrations have been reduced dramatically. In addition, an air sparging system was installed in November 1996 and became operational on December 16, 1996 (see Item b). This system was added to accelerate site cleanup; and current data suggest the air sparging system is highly effective.

As described in item b.4. (below), and as previously reported, the ground water and soil remediation systems were deactivated on May 23, 1997, in accordance with S.C.IV.10 and X.3. On December 30, 1997, limited ground water corrective actions (pumping POC-3 and air sparging at SP-1 and SP-2) were proactively reinitiated on a continuous basis.

The soil vapor extraction (SVE) system had been operating from January 24, 1994 to May 23, 1997. Rainy seasons had resulted in periods when the SVE system could not operate due to high water levels. Soil compaction had also hindered operation of the SVE system. An SVE well point pilot test was initiated in October, 1995 and is described in Item 1. Results showed significant reductions in soil vapor concentrations. Organic compound removal efficiency in the recovered soil vapor air stream ranged from 99.4 percent to greater than 99.9 percent. The SVE system is no longer in operation.

Item b. Any minor revisions or adjustments to the treatment and recovery system or plan.

The following adjustments have been made:

1. To maximize effectiveness and efficiency of ground water cleanup, on February 9, 1995, wells POC-2 and POC-3 were equipped to serve as temporary recovery wells and supplement pumpage from recovery wells RW-1 and RW-2, as previously reported. Drop pipes were installed in POC-2 and POC-3 and connected to a common header. Water is pumped from these wells via a diaphragm suction pump into the oil/water separator, then treated as usual.
2. Temporary SVE well points were installed and testing initiated in October 1995 (see Item 1). The original SVE system blower was removed and a mobile blower was subsequently used.
3. In November 1996, two air sparging points were added to the system to accelerate site cleanup. As agreed with FDEM on October 1, 1996, this adjustment is an interim measure and does not require a permit modification. Air sparging point

SP-2 is located approximately 9 ft west-southwest of monitor well POC-2, and SP-1 is located approximately 17 ft west of POC-3. The sparge point construction logs were provided in the January 29, 1997 quarterly report. After installation of the air compressor, operation of the air sparging system began on December 16, 1996. Subsequent data suggest that the air sparging system is significantly enhancing the ground water cleanup efforts.

4. As previously reported, the ground water and soil remediation systems were deactivated on May 23, 1997, in accordance with S.C.IV.10 and X.3. On December 30, 1997, limited ground water corrective actions (pumping POC-3 and air sparging at SP-1 and SP-2) were proactively reinitiated on a continuous basis.

Item c. Any proposed modification to the treatment and recovery system.

No modifications are proposed at this time.

Item d. Complete inspection logs for previous three months. These logs must include inspections of the recovery well pump(s) and treatment systems.

Operation and maintenance logs are provided in Appendix D.

Item e. Record of when the treatment system is operating.

The ground water treatment system is designed to shut off automatically by a high-level switch in the oil/water separator, and by a high-level switch in the infiltration gallery. The infiltration gallery high-level switch shut off is equipped with a timer set at 5 hours. This timer affects automatic restart of the system, unless water levels have not receded to below the cut off level. Automated operation was continuous throughout the quarter. Approximately 184,800 gallons of water from POC-3 were recovered and treated this quarter.

Item f. Total volume of processed ground water.

As of February 27, 1998, a grand total of approximately 5,654,000 gallons of ground water had been recovered and treated; this also includes water treated during the Phase 1 and Phase 2 startup testing program.

Item g. Summary of influent/effluent data, chain-of-custodies, and lab reports.

Appendix C is comprised of chain-of-custodies and lab reports pertaining to the ground water remediation system for December 1997, and January and February, 1998. Influent and effluent analytical data for ground water are summarized in Table 3.

Item h. Summary of ground water data (including graphical representation) with emphasis on the most common contaminants and those most difficult to treat.

Period of record ground water quality data for monitor wells POC-2 and POC-3 are presented in Figures 2 and 3, respectively. These are the only two wells at the site that typically indicate ground water impacts. The figures provide graphs of concentrations through time for the following analytes: benzene, chlorobenzene, ethylbenzene, xylenes and naphthalene. The long term trend is toward decreasing concentrations for all constituents. These trends are further discussed in the Quarterly Ground Water Monitoring Report section of this document.

Item i. Ground water elevation contour maps for previous six months.

Ground water elevation contour maps are provided for the following dates: November 18, 1997 (Figure 4); and February 24, 1998 (Figure 1).

Item j. Record of repairs (wells, piping, etc.).

- The ground water system totalizing flow meter was previously replaced. The grand total flow is now calculated as the direct reading from the existing meter plus 4,178,000 gallons (from previous meters).
- The air sparging compressor and POC-3 pump were brought online this quarter.
- Chlorine and bromine tablets were emplaced in the oil/water separator to reduce biofouling of the ground water treatment system.
- Water filters were replaced, as necessary.

Item k. Figure depicting the zone of capture of the recovery wells including delineation of stagnation points.

Pursuant to Specific Condition IV.12 of the closure permit, water table elevation contour maps are presented in Figures 1 and 4. These maps depict water table elevations in November 1997 and February 1998, as indicated in Item i. The capture zone appears to fully envelope the area of ground water impacts.

Item l. Soil venting data.

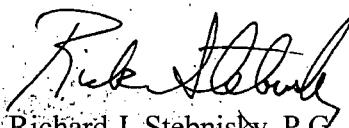

Not applicable.

Well Casing Diameter:

Volume of Water in Well (gal.):

Method of Purging: Pump Bailer (circle one)

Pump Rate: (gal/min)

VOLUME/LINEAR FT. OF PIPE	
I.D.(in)	Gal
2	0.163
4	0.663
6	1.47

Method of Determining Purged Volume :

Bailer No.: _____

Bailer Source: _____

Precleaned: Y N

Equipment Blank Collected : Yes No

Equipment: _____

Sample I.D. _____

FIELD PARAMETER STABILIZATION

Volume 1

Volume 2

Volume 3

Volume 4

Volume 5

Volume of Water to be Removed (gal) _____

Time (military) 7:00

pH (standard units) 7.0

Conductivity (μhos/CM) 250

Temperature (°C) 24

Actual Volume of Water Removed _____

Sediment/Turbidity 1.85

Color _____

Odor (Circle One or More): None / Natural Organic / Chemical Organic / Gasoline / Diesel (Oil) / Other (Describe):

OBSERVATIONS: Well being purged for system

Free product in well ~ 2 feet

well setup for purge and sample as ASA

SAMPLE COLLECTION ORDER: _____

pH Verified with pH Paper: Yes No

Additional Quantities of Preservative Added: _____

LABORATORY REPORT

Safety-Kleen Corporation
4800 S Old Peachtree Road
Norcross, GA 30071

January 20, 1998

Attention: Mr. Gary Risse

P.O. No. E13353

Report No. 90409-2

Sample Description

Groundwater, grab, SK-Tampa (Manhattan Ave), Project #97044-1111,
Intercarbon 123097, 12/30/97, 15:03, received 12/31/97

RESULTS

<u>Metals</u>	<u>Result</u> (mg/l)	<u>Detection</u> <u>Limit</u> (mg/l)
Total Arsenic (As) (EPA 6010).....	BDL	0.005
Total Barium (Ba) (EPA 6010).....	0.004	0.001
Total Cadmium (Cd) (EPA 6010).....	BDL	0.001
Total Chromium (Cr) (EPA 6010).....	BDL	0.001
Total Lead (Pb) (EPA 6010).....	BDL	0.004
Total Mercury (Hg) (EPA 7470).....	BDL	0.0002
Total Selenium (Se) (EPA 6010).....	BDL	0.006
Total Silver (Ag) (EPA 6010).....	BDL	0.0009
<u>BTEX (EPA 8020)</u>		<u>(ug/l)</u>
Benzene.....	BDL	0.26
Ethylbenzene.....	BDL	0.24
Toluene.....	BDL	0.48
Xylenes.....	BDL	0.82

BDL - Below Detection Limit

Groundwater, grab, SK-Tampa (Manhattan Ave), Project #97044-1111,
Intercarbon 123097, 12/30/97, 15:03, received 12/31/97

RESULTS

<u>Halogenated Volatile Organics (EPA 8010)</u>	<u>Result (ug/l)</u>	<u>Detection Limit (ug/l)</u>
Benzyl chloride.....	BDL	0.84
Bromobenzene.....	BDL	0.22
Bromodichloromethane.....	BDL	0.36
Bromoform.....	BDL	0.34
Bromomethane.....	BDL	0.97
Carbon tetrachloride.....	BDL	0.34
Chlorobenzene.....	BDL	0.64
Chloroethane.....	BDL	0.77
Chloroform.....	BDL	0.25
2-Chloroethylvinyl ether.....	BDL	0.65
Chloromethane.....	BDL	0.61
Dibromochloromethane.....	BDL	0.42
Dibromomethane.....	BDL	0.28
1,2-Dichlorobenzene.....	BDL	0.49
1,3-Dichlorobenzene.....	BDL	0.32
1,4-Dichlorobenzene.....	BDL	0.39
Dichlorodifluoromethane.....	BDL	0.49
1,1-Dichloroethane.....	BDL	0.43
1,2-Dichloroethane.....	BDL	0.40
1,1-Dichloroethene.....	BDL	0.72
trans-1,2-Dichloroethene.....	BDL	0.45
1,2-Dichloropropane.....	BDL	0.28
cis-1,3-Dichloropropene.....	BDL	0.27
trans-1,3-Dichloropropene.....	BDL	0.21
Methylene chloride.....	BDL	0.37
1,1,2,2-Tetrachloroethane.....	BDL	0.25
1,1,1,2-Tetrachloroethane.....	BDL	0.21
Tetrachloroethene.....	BDL	2
1,1,1-Trichloroethane.....	BDL	0.38
1,1,2-Trichloroethane.....	BDL	0.25
Trichloroethene.....	BDL	0.26
Trichlorofluoromethane.....	BDL	1.79
Vinyl chloride.....	BDL	1.28

Re: 1997 4th Quarter Monitoring Report
Safety-Kleen Corp., Manhattan Avenue, Tampa Facility
Closure Permit No. HF29-158003
EPA ID No. FLD 049 557 408

Dear Mr. Crawford:

On behalf of Safety-Kleen Corp., Environmental Consulting & Technology, Inc. (ECT) herein submits results of the November 1997 quarterly ground water monitoring pursuant to Specific Conditions (S.C.) IV.4 and IV.11 of the referenced permit.

Safety-Kleen currently awaits FDEP issuance of the renewal permit; the permit application was submitted on March 27, 1997. Safety-Kleen also awaits Department approval to implement the March 1997 soil sampling plan to document clean closure of the soil. Safety-Kleen wishes to proactively close this facility without further delays by FDEP.

QUARTERLY GROUND WATER MONITORING REPORT

Ground water samples and water level data were collected in November 1997 according to procedures described in the closure permit for the facility. The ground water samples were submitted to Analytical Services, Inc. (ASI) for analysis of the parameters listed in Specific Condition IV.3 of the closure permit as modified on August 7, 1996.

Ground water samples were collected from nine monitor wells on November 18 and 19, 1997. As is commonly the case during wet periods, two monitor wells located offsite to the east (SA-3 and DA-4D) were under water and could not be sampled. Monitor well sampling data forms are provided in Appendix A. Ground water levels and total well depths were measured at each well sampled. Ground water elevation data for November 18, are presented in Table 1, and a water table elevation contour map is shown in Figure 1. The inferred ground water flow direction is toward the east/northeast, consistent with historical data for ambient, nonpumping conditions.

The laboratory report of ground water quality analytical methods and results is presented as Appendix B. Table 2 provides a summary of all constituents detected in ground water. Concentration trends for select analytes are illustrated in Figure 2 for monitor well POC-2 and Figure 3 for monitor well POC-3. Well locations are shown in Figure 1.

Mr. Bill Crawford
January 20, 1998
Page 2

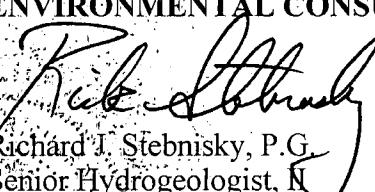

Several organic compounds were detected in low concentrations at monitor well POC-3: naphthalene was detected at a concentration of 26 µg/L, which is above its organoleptic based ground water guidance concentration, yet almost 60 times lower than EPA's 1,500 µg/L drinking water standard; total xylenes was detected at 30 µg/L, which is also slightly above its organoleptic based standard, yet 333 times lower than its health-based primary drinking water standard of 10,000 µg/L. Monitor well POC-2 has not exceeded any ground water standard since November 1996. Period of record trends show that all constituent concentrations have decreased significantly at these wells (Figures 2 and 3). The observed decreases are likely the result of ground water recovery and the treatment system adjustments previously reported. As usual, concentrations of metals were generally below detection limits or very low. Metals are clearly not a problem at this facility.

As previously reported, the ground water and soil remediation systems were deactivated on May 23, 1997, in accordance with S.C. IV.10 and X.3. Safety-Kleen continues to diligently maintain the remedial systems to keep them operable and minimize deterioration of the equipment. This quarter the POC wells were redeveloped, and the systems were operated temporarily on three occasions. Well POC-3 was pumping during this quarter's sampling event.

If you have any questions or comments regarding this quarterly monitoring report, please contact me at (813) 289-9338 or Gary Risse of Safety-Kleen at (770) 418-1860. Thank you.

Sincerely,

ENVIRONMENTAL CONSULTING & TECHNOLOGY, INC.

Richard T. Stebnisky, P.G.

December 8, 1997

P.O. No. E13353

Attention: Mr. Gary Risse

Report No. 89028-12

Sample Description

Water, SK-Tampa (Manhattan Ave), Project #97044-1111, Dupe-1, 11/19/97,, received 11/20/97

RESULTS

	<u>Result</u>	<u>Detection Limit</u>
Turbidity (NTU) (EPA 180.1)	6.2	0.05
Total Sulfide (S) (mg/l) (SM 4500-S D)	0.35	0.1
Metals	<u>(mg/l)</u>	<u>(mg/l)</u>
Total Arsenic (As) (EPA 6010)	BDL	0.005
Total Barium (Ba) (EPA 6010)	0.01	0.001
Total Beryllium (Be) (EPA 6010)	BDL	0.0004
Total Cadmium (Cd) (EPA 6010)	BDL	0.001
Total Chromium (Cr) (EPA 6010)	BDL	0.001
Total Copper (Cu) (EPA 6010)	0.02	0.01
Total Lead (Pb) (EPA 6010)	BDL	0.004
Total Mercury (Hg) (EPA 7470)	BDL	0.0002
Total Nickel (Ni) (EPA 6010)	0.007	0.002
Total Silver (Ag) (EPA 6010)	BDL	0.0009
Total Zinc (Zn) (EPA 6010)	0.0355	0.008
Total Vanadium (V) (EPA 6010)	0.006	0.002
