**RE: SITE ASSESSMENT REPORT
LIBERTY TIRE RECYCLING, LLC (FORMERLY FLORIDA TIRE RECYCLING, INC.)
9675 RANGE LINE ROAD, PORT ST. LUCIE, FLORIDA**

Dear Mr. Woodward:

Golder Associates Inc. (Golder) has prepared this Site Assessment Report (SAR) summarizing site investigation activities performed at the Liberty Tire Recycling (Liberty Tire) facility in Port St. Lucie, Florida. The purpose of the investigation was to assess potential contamination related to two fires (August and October 2010) that occurred in piles of shredded tires stored at the southwest portion of the property.

BACKGROUND AND PURPOSE

The site is an active tire recycling facility located at 9675 Range Line Road, Port St. Lucie, Florida (Figure 1). On August 31, 2010, a fire ignited near the southwest corner of the facility in the main shredded tire storage area. The fire was contained on September 1, 2010 and additional water was applied to the area to cool tire material through September 3, 2010. During fire-fighting activities, run-off water entered the neighboring property to the west, currently used for cattle ranching. Berms constructed to contain run-off were not completed until September 2, 2010 due to safety considerations and access restrictions during active fire-fighting activities. Liberty Tire contracted Hydrologic Associates USA, Inc. (HAU) to install absorbent material to mitigate impacts associated with run-off along the property boundary on September 2 and 3, 2010.

On October 6, 2010, a second fire ignited in the main shredded tire storage area. High winds spread the fire quickly and ignited an adjacent pile of heavy and off-road equipment tires. The fire was extinguished on the night of October 6, 2010 and additional water was applied to the material until the afternoon of October 7, 2010. Although run-off water in the main shredded tire storage area was contained by berms constructed during the August 31, 2010 fire, water was observed flowing offsite to a ditch along the south border of the heavy and off-road equipment tire pile. Since the occurrence of the second fire, Liberty Tire has removed fire-damaged material from the location.

Golder mobilized to the site on February 3 and 4, 2011 to collect soil, surface water and groundwater samples to identify constituents of concern (COCs) for the next phase of assessment work. Based on Golder's findings and results of HAU's sampling, Golder performed additional assessment activities on May 4 through May 6, 2011 to install monitoring wells and to collect soil and groundwater samples, as depicted in Figure 2. Follow-up delineation and confirmation sampling was performed on June 14, 2011.

PRELIMINARY INVESTIGATION ACTIVITIES

Soil Screening and Sampling

A soil, surface water and groundwater investigation was conducted in February 2011 to characterize potential impacts in suspected soil source areas in the southwest corner of the property, as well as immediately west of the property boundary. Borings were advanced to approximately 4 feet below ground surface (bgs), the approximate depth of the water table across the site, to collect soil samples from five boring locations (see Figure 3). Soil samples were collected at the following intervals; 0-0.5 feet bgs, 0.5-2 feet bgs, and 2-4 feet bgs, and field screened for volatile organic compounds (VOCs) using an organic vapor analyzer (OVA). Soil samples were submitted to a National Environmental Laboratory Accreditation Conference (NELAC) certified laboratory for analysis of VOCs by Environmental Protection Agency (EPA) Method 8260, semivolatile organic compounds (SVOCs) by EPA Method 8270, total recoverable petroleum hydrocarbons (TRPH) by the Florida PRO (FL PRO) Method, and the Target Analyte List of metals, plus titanium, by EPA Method 6010. The samples from the upper two intervals (0- 0.5 feet bgs and 0.5-2 feet bgs) were analyzed while the 2-4 feet bgs samples were placed on hold. After review of the results, certain deeper samples were analyzed for a limited scope of constituents of concern to evaluate the potential vertical extent of impacts. Soil screening and sampling logs are included in Attachment A.

Results indicated that only one soil boring location contained constituents in soil that exceeded Florida Department of Environmental Protection (FDEP) commercial/industrial soil cleanup target levels (SCTLs). TRPHs were detected at boring GSB-3 0-0.5' bgs (4,700 mg/kg), at a concentration greater than the SCTL value of 2,700 mg/kg. In the same sample, benzo(a)pyrene was detected at a concentration of 1.2 mg/kg, greater than the SCTL of 0.7 mg/kg and the benzo(a)pyrene toxicity equivalent quotient (TEQ) was calculated at 1.5 mg/kg, greater than the benzo(a)pyrene TEQ value of 0.7 mg/kg. Soil screening locations are presented on Figure 3. A summary of detections in soil is presented in Table 1 and the benzo(a)pyrene TEQ calculation summary is presented in Table 2.

Surface Water Sampling

Surface water samples were collected from four locations (GSW-1, GSW-2, GSW-3, and GSW-4), located in the southwestern corner of the property. Surface water sample GSW-1 was collected from an onsite drainage ditch to the north and east of the former scrap tire piles. GSW-2 was collected from a pool of standing water within the footprint of the former scrap tire piles. GSW-3 was collected from the drainage ditch directly south of the former scrap tire piles and GSW-4 was collected from the small irrigation pond on the adjacent property west of the former scrap tire piles. Surface water samples were submitted to the laboratory to be analyzed for the same constituents as the soil samples. For surface water samples collected from surface water features located on the facility property, no constituents were detected at concentrations greater than the Class V surface water standards. For surface water samples collected from sampling locations GSW-3 and GSW-4 on the adjacent ranch property, only zinc (8,900 µg/L) was detected in the sample from GSW-3 at a concentration greater than the Class V commercial/industrial surface water standard of 1,000 µg/L. In May 2011, an excavation of the surface of the southern ditch banks was performed by Liberty Tire, and Golder returned to the property on June 14th, 2011 to perform follow-up confirmation sampling at GSW-3. Laboratory results indicated that following excavation activities, zinc was reported at a concentration of 196 µg/L, which does not exceed the Class V surface water standard of 1,000 µg/L. Surface water sampling locations are presented on Figure 3 and the summary of surface water detections is presented in Table 3.

Groundwater Sampling

During the preliminary assessment, one temporary piezometer was installed on the offsite property west of the southwest corner of the property boundary. The piezometer was constructed of 1-inch diameter Schedule 40 polyvinyl chloride (PVC) casing flush threaded (w/o-ring) to a 0.01-inch slot size Schedule 40 PVC screen. The 5-foot long well riser and 5-foot long screen were connected with flush-threaded joints and installed to 7 feet bgs. Annular space between the borehole wall and the well screen was filled with 20/30 grade silica sand filter pack from the bottom of the borehole to the top of the well screen. The

piezometer was developed by purging a sufficient volume to clear fines from the surrounding formation and to reduce turbidity in the groundwater sample. Additionally, water quality parameters including; pH, specific conductance (SC), temperature, turbidity, dissolved oxygen (DO), and oxidation reduction potential (ORP), were measured using calibrated electronic water quality equipment (i.e., YSI 556 MPS and Hach 2100P) and recorded in the field. The groundwater sample was submitted for laboratory analysis of constituents listed above for soil and surface water samples.

Groundwater collected from the temporary piezometer GPZ-1, contained some common naturally-occurring metals (aluminum, arsenic, iron and thallium) that exceeded GCTLs. The piezometer location is presented on Figure 3 and the results of detections are summarized in Table 4. These constituents were likely elevated because the temporary piezometer produced samples with higher turbidity, resulting in metals concentrations that do not represent true dissolved concentrations. A permanent well was installed in the vicinity of GPZ-1 during the May event. Please see the results for this well in the text below.

SECOND PHASE INVESTIGATION ACTIVITIES

Soil Screening and Sampling

Golder returned to the site on May 4th through 6th to further delineate potential impacts. Borings were advanced to approximately 4 feet below ground surface (bgs), the approximate depth of the water table across the site, to collect soil samples from 20 boring locations (see Figure 4). Thirteen soil borings were advanced from within the footprint of the former shredded tire and off-road tire piles; five borings were located offsite adjacent to the property boundary; and two soil samples, one onsite (GSB-24) and one offsite (GSB-25), were collected far from the investigation area to serve as background soil samples. Soil samples were collected at the same intervals as before and field screened for VOCs using an OVA. Soil samples were collected from the three intervals in each soil boring location. The samples from the upper two intervals (0- 0.5 feet bgs, 0.5-2 feet bgs) were submitted to a NELAC-certified laboratory for analysis while the 2-4 feet bgs samples were again placed on hold pending receipt of shallow sample analytical data. Based on detections of constituents reported during the preliminary investigation, samples collected during the second phase of investigation were analyzed for VOCs by EPA Method 8260; SVOCs by EPA Method 8270 and EPA Method 8270 SIM; TRPH by the FL PRO Method; and aluminum, arsenic, iron, manganese, thallium, and zinc by EPA Method 6010. After review of the results, certain deeper samples were analyzed for a limited scope of constituents of concern to establish vertical delineation of impacted soil. Soil screening and sampling logs are included in Attachment A.

Results indicated that none of the soil samples exceeded FDEP commercial/industrial SCTLs for metals or VOCs. Benzene was detected at a concentration slightly greater than the leachability value of 7 µg/kg in soil sample GSB-13 0-0.5' (7.29 µg/kg); however, because benzene was not detected in groundwater or surface water samples, only the direct exposure SCTLs would apply for benzene. The summaries of detections for metals and VOCs in soil are presented in Tables 5 and 6, respectively.

TRPH was detected in the sample collected from boring GSB-13 at 0-0.5 foot bgs (4,420 mg/kg) at a concentration greater than the SCTL value of 2,700 mg/kg. In 12 additional samples, TRPH was detected at concentrations greater than the leachability SCTL of 340 mg/kg. TRPH speciation by TPHCWG Method was performed for four of the samples with the most elevated concentrations of TRPH, to evaluate if specific carbon chains exceeded their CTLs. Speciation results indicated that none of the samples exceeded the CTLs for the carbon chain groups. Summaries of detections for TRPH are presented in Table 7 and TRPH speciation data are presented in Table 8.

Laboratory results indicated that the soil samples GSB-13 0-0.5' and GSB-25 0-0.5' exceeded the commercial/industrial cleanup target level for benzo(a)pyrene. Benzo(a)pyrene TEQs were detected at concentrations above residential SCTLs in soil samples GSB-6 0-0.5', GSB-11 0-0.5', GSB-12 0-0.5', GSB-13 0.5-2', GSB-19 0-0.5', and GSB-21 0.5-2'.

Background soil boring GSB-25 was located along the south drainage ditch near an asphalt-paved surface and trace amounts of asphalt may have been present in the 0-0.5 foot sample, contributing to elevated concentrations of TRPHs and SVOCs. Golder returned to the site on June 14, 2011 to provide additional lateral delineation to residential SCTLs on the eastern side of the impacts for benzo(a)pyrene TEQs and to take a confirmation sample of boring location GSB-25 (soil sample GSB-25C 0-0.5'). To prevent possible asphalt contamination, vegetation and the top inch of top-soil was stripped before collecting the soil sample. Analytical results indicated that soil samples collected from GSB-25C and GSB-26 did not contain TRPH or benzo(a)pyrene TEQs above residential SCTLs. A summary of SVOC detections in soil is presented in Table 9 and the benzo(a)pyrene TEQ calculation summary is presented in Table 10.

Monitoring Well Installation

During the second phase of the assessment, three monitoring wells were installed onsite within the footprint of the former scrap tire piles and four monitoring wells were installed on the offsite property in locations where runoff water from fire-fighting activities had been observed. Prior to conducting intrusive investigation activities, a pilot boring was advanced at each monitoring well location to approximately 4 feet bgs to check for underground utilities. Once the location was cleared of underground utilities, a shallow soil boring was advanced using a hollow-stem auger (HSA) attachment on a Geoprobe 6620 DT drill rig. Drill cuttings were observed during the drilling to describe the encountered lithology and determine an appropriate interval (i.e., apparent high transmissivity) for monitoring well screen placement. Once an appropriate interval was identified, based on lithology, the monitoring well was installed.

Based on the water table observed in GPZ-1, the monitoring wells were installed to approximately 12 feet bgs to monitor the shallow surficial aquifer and intercept the water table. The 10-foot well screens were set between 2 and 12 feet bgs.

The newly-installed monitoring wells were constructed of 2-inch diameter Schedule 40 polyvinyl chloride (PVC) casing flush threaded (w/o-ring) to a 0.01-inch slot size Schedule 40 PVC screen. The well risers and screens were connected with flush-threaded joints. Annular space between the borehole walls and the well screens were filled with 20/30 grade silica sand filter pack from the bottom of the boreholes to the top of the well screens. An approximate one-foot thick fine (i.e., 30/65) grade silica sand seal was placed above the sand filter pack. The remaining open annulus was filled with Portland cement grout to complete the surface seal.

The wells were completed with aluminum "stick-up" protective casings. The casings were secured in 2-foot square by approximately 6-inch deep concrete pads which sloped away from the well to prevent surface water infiltration. The risers were capped with a water-tight expandable locking plug. Locations of monitoring wells are presented on Figure 5. Monitoring well construction details are summarized in Table 11 and well installation logs are included in Attachment B.

Well development was performed to establish a good hydraulic connection with the aquifer. Development was continued until the purged water remained visibly clear of suspended solids.

All existing and newly installed well locations were surveyed for x,y,z coordinates by a Florida-registered land surveyor. The top-of-casing (TOC) and ground surface of each well were surveyed consistent with North American Vertical Datum of 1988 (NAVD 88).

Investigation Derived Waste (IDW) (e.g., drill cuttings and development water) was containerized in 55-gallon drums and staged at the Site for future disposal in accordance with state and federal regulations as non-hazardous waste.

Groundwater Elevation Measurements

A synoptic round of water level measurements was completed on May 6, 2011. Depth to groundwater was measured at each well to the nearest 0.01-foot relative to the top of the well casing using an electronic water level indicator. Groundwater elevations relative to the North American Vertical Datum

(NAVD) of 1988 were calculated based on the water level measurements and TOC surveyed elevations (Table 10). The calculated groundwater elevations were used to develop a potentiometric contour map, presented on Figure 6. Based on the interpreted potentiometric surface, the groundwater flow direction in the shallow zone of the surficial aquifer is to the southwest.

Using the hydraulic conductivity values and well to well distance measurements, the hydraulic gradient was calculated to be 0.001 feet/foot (ft/ft). This calculated gradient represents that the surface of the shallow surficial aquifer is relatively flat, indicative of relatively slow moving groundwater. Groundwater flow and horizontal hydraulic gradient calculations are presented in Attachment C.

Groundwater Sampling Procedures

Groundwater samples were collected on May 6, 2011 from the seven monitoring wells located on and adjacent to the site. Prior to sampling, the monitoring wells were purged a minimum of one well volume to assure representative formation groundwater was sampled. Additionally, water quality parameters including; pH, SC, temperature, turbidity, DO, and ORP, were measured using calibrated electronic water quality equipment (i.e., YSI 556 MPS and Hach 2100P) and recorded in the field. Once WQP readings stabilized (e.g., generally three consecutive readings within published deviations), groundwater samples were collected. Field sample records and equipment calibration records are provided in Attachment D.

All groundwater samples were placed in laboratory provided sample containers, labeled, carefully packed into a standard cooler with ice, and submitted to a NELAC-certified laboratory. Samples were submitted for analysis of VOCs by EPA Method 8260; SVOCS by EPA Method 8270; TRPH by FL PRO method; and aluminum, arsenic, iron, manganese thallium, and zinc by EPA Method 6010.

Groundwater Sampling Results

A brief discussion of the analytical results is presented below. A summary of detections for each groundwater sample collected are summarized on Table 12. Complete groundwater analytical laboratory reports and chain-of-custody forms are included in Attachment E.

VOCs, and TRPH were not detected at concentrations above GCTLs in groundwater samples from the monitoring wells. Bis(2-ethylhexyl)phthalate was detected in the sample from MW-7 at a concentration of 45.3 µg/L, greater than the GCTL of 6 µg/L. Bis(2-ethylhexyl)phthalate was not detected above the MDL in the other groundwater samples collected from onsite or offsite monitoring wells.

Aluminum was detected in the sample collected from MW-3 at a concentration of 0.328 milligrams per liter (mg/L), greater than the GCTL of 0.2. Arsenic was detected only in offsite monitoring well MW-7, at a concentration of 0.011 mg/L, slightly over than the GCTL of 0.010 mg/L. Iron was detected in samples from each well, except MW-2, at concentrations greater than the GCTL (which is a secondary drinking standard MCL and not a health-based standard). Iron exceedances reported for the samples ranged from 2.52 mg/L to 20.7 mg/L. Manganese was detected in three wells, MW-1 (1.13 mg/L), MW-2 (1.24 mg/L), and MW-6 (0.0609 mg/L) at concentrations greater than the GCTL of 0.05 mg/L. Zinc was not detected in samples at concentrations greater than GCTLs, and thallium was not detected above the method detection limit.

CONCLUSIONS AND RECOMMENDATIONS

Soil sampling results indicate that only samples GSB-3 0-0.5' and GSB-13 0-0.5' exceeded commercial/industrial SCTLs for benzo(a)pyrene and the benzo(a)pyrene TEQs, and that delineation to residential CTLs has been satisfied. Based on TRPH speciation results, soil with the highest concentrations of TRPH did not exceed residential or commercial cleanup target levels for individual carbon chain groups. Thus, we can conclude that the remainder of the samples, which had concentrations of TRPH less than the samples for which speciation was analyzed, do not exceed the TRPH carbon chain-specific SCTLs. Golder recommends performing a source removal around GSB-3 and GSB-13 to 1' bgs to remove impacted soil (see Figure 4 for approximate excavation boundary).

Notes:

bgs - below ground surface

NS - sample was not analyzed for the constituent at this interval

V - Method Blank Contamination

J4 - Estimated Result

BaP TEQ - cumulative criteria for these parameters compared to criteria for benzo(a)pyrene.

VOCs - Volatile Organic Compounds

While the entire VOC list was analyzed, only those parameters for which at least one detection was reported are listed in the table.

SVOCs - Semi-volatile Organic Compounds

While the entire SVOC list was analyzed, only those parameters for which at least one detection was reported are listed in the table.

* - Contaminant is not a health concern for this exposure scenario

** - Direct exposure value based on acute toxicity considerations

Bold font indicates constituent concentration was reported above the laboratory reported method detection limit.

Shading indicates exceedance of FDEC commercial direct exposure soil cleanup target levels

NA - FDEC soil cleanup target level criteria not available

U - The compound was analyzed for but not detected

I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

Q - sample analyzed outside of hold time

TRPH - Total Recoverable Petroleum Hydrocarbons

Notes:

bgs - below ground surface
 mg/kg - milligrams per kilogram
 MDL - Method Detection Limit
 PQL - Practical Quantitation Limit
 PAHs - Polycyclic Aromatic Hydrocarbons

- Concentrations for listed PAHs must be converted to benzo(a)pyrene TEQ values

Total TEQ - Sum of the TEQ concentrations of listed PAH parameters compared to the appropriate direct exposure SCTL for benzo(a)pyrene using the approach described in the February 2005 Final Technical Report: Development of Cleanup Target Levels For Chapter 62-777, F.A.C.

To Calculate:
 If the value is greater than the PQL and is not estimated, then use the stated value.
 I - The reported value is between the laboratory MDL and the laboratory PQL, use full value.
 U - Compound was analyzed for, but not detected. The reported value is the laboratory MDL, use 1/2 the value.

TEF - Toxicity Equivalency Factor used to convert specific PAHs to benzo(a)pyrene equivalents.
 TEQ - Toxicity Equivalent
 SCTL - Soil Cleanup Target Level per Chapter 62-777, Table II, F.A.C.
 Bold font indicates constituent concentration was reported above the laboratory reported method detection limit.

Shading indicates exceedance of FDEP commercial direct exposure soil cleanup target levels

Notes:

bgs - below ground surface

* - Contaminant is not a health concern for this exposure scenario

** - Direct exposure value based on acute toxicity considerations

*** - Leachability values may be derived using the SPLP Test to calculate site-specific SCTLs or may be determined using TCLP in the event oily wastes are present.

NS - sample was not analyzed for the constituent at this interval

U - The compound was analyzed for but not detected

I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

Bold font indicates constituent concentration was reported above the laboratory reported method detection limit.

Shading indicates exceedance of FDEP commercial direct exposure soil cleanup target levels

Notes:

bgs - below ground surface

U - The compound was analyzed for but not detected

I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

TRPH - Total Recoverable Petroleum Hydrocarbons

Regulatory and Guidance Limits are taken from Florida Administrative Code 62-770

Bold font indicates a detection above the method detection limit (MDL)

Notes:															
bgs - below ground surface															
NS - sample was not analyzed for the constituent at this interval															
U - The compound was analyzed for but not detected															
I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.															
J - Estimated Result															
SVOCs - Semi-volatile Organic Compounds															
While the entire SVOC list was analyzed, only those parameters for which at least one detection was reported are listed in the table.															
BaP TEQ - cumulative criteria for these parameters compared to criteria for benzo(a)pyrene.															
Bold font indicates constituent concentration was reported above the laboratory reported method detection limit.															
Shading indicates exceedance of FDEP commercial direct exposure soil cleanup target levels

Notes: bgs - below ground surface mg/kg - milligrams per kilogram MDL - Method Detection Limit PQL - Practical Quantitation Limit PAHs - Polycyclic Aromatic Hydrocarbons # - Concentrations for listed PAHs must be converted to benzo(a)pyrene TEQ values. Total TEQ - Sum of the TEQ concentrations of listed PAH parameters compared to the appropriate direct exposure SCTL for benzo(a)pyrene using the approach described in the February 2005 Final Technical Report: Development of Cleanup Target Levels For Chapter 62-777, F.A.C. To Calculate: If the value is greater than the PQL and is not estimated, then use the stated value. I - The reported value is between the laboratory MDL and the laboratory PQL, use full value. U - Compound was analyzed for, but not detected. The reported value is the laboratory MDL, use 1/2 the value.												
TEF - Toxicity Equivalency Factor used to convert specific PAHs to benzo(a)pyrene equivalents. TEQ - Toxicity Equivalent SCTL - Soil Cleanup Target Level per Chapter 62-777, Table II, FAC. Bold font indicates constituent concentration was reported above the laboratory reported method detection limit. Shading indicates exceedance of FDEP commercial direct exposure soil cleanup target levels

SUBJECT: HORIZONTAL HYDRAULIC GRADIENT CALCULATIONS

Job No. 103-82740

Ref. Figure 6.

Made by JCK

Checked KPC

Reviewed CM

Date 6/23/11

Sheet 1 of 1

Purpose

To estimate the average horizontal hydraulic gradient of the shallow surficial aquifer at the Liberty Tire Recycling Facility in Port St. Lucie, FL

Method

Using groundwater elevations measured at the site on May 6, 2011 and the surveyed locations of the wells, a 3-point analysis was performed using wells to estimate an average horizontal hydraulic gradient.

Reference - Figure 6 - Potentiometric Map, Shallow Surficial Aquifer - May 6, 2011.

NOTES: 1. The above do not constitute all of the information required by Chapter 62-160, F.A.C.

2. STABILIZATION CRITERIA FOR RANGE OF VARIATION OF LAST THREE CONSECUTIVE READINGS (SEE FS 2212, SECTION 3)

pH: ± 0.2 units. Temperature: $\pm 0.2^\circ\text{C}$ Specific Conductance: $\pm 5\%$ Dissolved Oxygen: all readings $\leq 20\%$ saturation (see Table FS 2200-2); optionally, $\pm 0.2 \text{ mg/L}$ or $\pm 10\%$ (whichever is greater). Turbidity: all readings $\leq 20 \text{ NTU}$; optionally $\pm 5 \text{ NTU}$ or $\pm 10\%$ (whichever is greater)

"J" = indicates that the calibration result for the parameter of concern was outside of the acceptable criteria for standard range.

Form FD 9000-7: Field Parameter Data Sheet for Surface Water

SURVEY/PROJECT: LIBERTY TREE RECYCLING

SAMPLERS: B. DUGAN / J. KENF

METER # 03599/HG-6

FIELD CONDITIONS FOR STATION# 65W-1 AT TIME 1458

CLOUD COVER (%): 70%

WIND DIRECTION: NE

TIDAL STAGE: N/A

PREVIOUS RAINFALL: INCH

WIND SPEED (MPH/KNOTS): 5-10 mph

WAVE CONDITIONS: LIGHT Choppy

Note: This Sheet is used for recording Sample Data – Calibration information must also be documented.

Golder Associates

Field Instrument Dissolved Oxygen Calibration Records

INSTRUMENT (MAKE/MODEL NO.) VSE 556

INSTRUMENT NO. 02519

STANDARD INFORMATION

Project Number: 103-82740

Project Name: Liberty Tire Recycling

Units: DO-mg/L ORP-mV

Standard Air Calibration Chamber in Air (Table FS 2200-2)

Standard ORP 220mV @25C

Standard

Acceptable calibration check is if the meter reads within +/- 0.3 mg/L of the value of appropriate calibration standard. Need to record DO readings in mg/L and use Table FS 2200-2 "Dissolved Oxygen Saturation".

**Golder
Associates**

Field Instrument Turbidity Calibration Records

INSTRUMENT (MAKE/MODEL NO.) *Hach 200*

INSTRUMENT NO. HT-6

Project Number: 103-82740

Project Name: Liberty Tire Recycling

Standard Vendor: Hach

Prepared Date: Aug '09 Where Prepared: Golder Assoc.

Purchase Date: Aug '09 **Expiration Date:** Aug '11 **Lot Number:** See below

Units:Nephelometric Turbidity Unit

Standard 0.1-10 Nephelometric Turbidity Unit Lot Number: A9212

Standard 11.0-40 Nephelometric Turbidity Unit Lot Number: A9211

Standard 41.0-100 Nephelometric Turbidity Unit Lot Number: A9216

Standard >100 Nephelometric Turbidity Unit Lot Number: A9215

Calibration values for turbidity needs to be within 10% of the standard for values between 0.1-10 NTU; 8% for values between 11-40 NTU; 6.5% for values between 41-100 NTU and 5% for values >100 NTU.

Field Instrument pH Calibration Records

INSTRUMENT (MAKE/MODEL NO.) NSE 556 **INSTRUMENT NO.** 02599

STANDARD INFORMATION

Project Number: 103-82740 **Project Name:** Liberty Tire Recycling

Standard Vendor: LSS

Prepared Date: April '10 **Where Prepared:** Golder Assoc.

Purchase Date: April '10 **Expiration Date:** See below **Grade:** _____ **Units:** Standard Units

Standard 4.01 @ 25 Deg C Lot # 0019-15 Exp Date: Jan '12 Purch Date: Apr '10

Standard 7.00 @ 25 Deg C Lot # 0008-24 Exp Date Jan '12 Purch Date Apr '10

Standard 10.0 @ 25 Deg C. Lot # 9364-03 Exp Date Jan '11 Purch Date Apr '10

Acceptable calibration check is if the meter reads within +/- 0.2 pH units of the value of appropriate calibration standard.

**Golder
Associates**

Field Instrument Conductivity Calibration Records

INSTRUMENT (MAKE/MODEL NO.) NSE 556

INSTRUMENT NO. 02599

STANDARD INFORMATION

Project Number: 103-82740 **Project Name: Liberty Tire**

Standard Vendor: GEOTECH

Prepared Date: NOV 2007 Where Prepared: GEOTECH

Grade: _____ **Units:** umhos/uS-cm

Standard 84 **Lot # 91589** **Exp Date Sept. '11** **Pur Date Sept '10**

Standard 500 **Lot # 91587** **Exp Date Sept. '11** **Pur Date** **Sept. '10**

Standard 2000 **Lot #** 91588 **Exp Date** Sept. '11 **Pur Date** Sept. '10

Acceptable calibration check is if the meter reads within +/- 5% of the appropriate calibration standard.

Form FD 9000-24

NOTES: 1. The above do not constitute all of the information required by Chapter 62-160, F.A.C.

2. STABILIZATION CRITERIA FOR RANGE OF VARIATION OF LAST THREE CONSECUTIVE READINGS (SEE FS 2212 SECTION 3)

pH: ± 0.2 units Temperature: $\pm 0.2^\circ\text{C}$ Specific Conductance: $\pm 5\%$ Dissolved Oxygen: all readings $\leq 20\%$ saturation (s)

optionally, ± 0.2 mg/L or $\pm 10\%$ (whichever is greater) **Turbidity:** all readings < 20 NTU; optional

"J" = indicates that the calibration result for the parameter of concern was outside of the acceptable criteria for standard range.

"J" = indicates that the calibration result for the parameter of concern was outside of the acceptable criteria for standard range.

Field Instrument pH Calibration Records

INSTRUMENT (MAKE/MODEL NO.) YSI 556 MPS INSTRUMENT NO. 4

STANDARD INFORMATION

Project Number: 5-6-11 Project Name: LIBERTY TIRE

Standard Vendor: LSS

Prepared Date: APR 2010 **Where Prepared:** GOLDER ASSOCIATES

Purchase Date: APR 2010 **Expiration Date:** Varies **Grade:** N/A **Units:** Standard Units

Standard 4.01 @25°C Lot # 0236-12 Exp Date AUG 2012 Purch Date APR 2010

Standard 7.00 @25 °C **Lot #** 0259-02 **Exp Date** SEP 2012 **Purch Date** APR 2010

Standard 10.0 @25 °C Lot # 0265-05 Exp Date SEP 2011 Purch Date APR 2010

Acceptable calibration check is if the meter reads within +/- 0.2 pH units of the value of appropriate calibration standard.

Field Instrument Conductivity Calibration Records

INSTRUMENT (MAKE/MODEL NO.) YSI 556 MPS **INSTRUMENT NO.** 4

STANDARD INFORMATION

Project Number: Project Name: L TIZ

Standard Vendor: AQUA SOLUTIONS/LABCHEM

Prepared Date: OCT 2010 **Where Prepared:** **GOLDER ASSOCIATES**

Grade: N/A **Units:** umhos/uS-cm

Standard 100@25 °C Lot # A082-11 Exp Date APR 2012 Pur Date MAR 2011

Standard 500@25 °C Lot # 91587 Exp Date SEP 2011 Pur Date SEP 2010

Standard 2000@25 °C Lot # 91588 Exp Date SEP 2011 Pur Date SEP 2010

Acceptable calibration check is if the meter reads within +/- 5% of the appropriate calibration standard.

Note: Standards and instrument response readings are corrected to 25°C

Field Instrument Dissolved Oxygen & Oxidation-Reduction Potential Calibration Records

INSTRUMENT (MAKE/MODEL NO.) YSI 556 MPS **INSTRUMENT NO.** 4

STANDARD INFORMATION

Project Number: **Project Name:** LTR

Standard Vendor: GEOTECH

Prepared Date: APR 2010 **Where Prepared:** GOLDER ASSOCIATES

Grade: N/A DO Units: mg/L ORP Units: mV

ORP Standard 220@25 °C Lot #11B102018 Exp Date OCT 2011 Pur Date MAR 2011

DO Standard Air Calibration Chamber in Air (Table FS 2200-2)

Standard _____

Standard _____

TIME	TEMP	CHART 100%	INSTRUMENT	% DEV	PASS
------	------	------------	------------	-------	------

Acceptable calibration check is if the meter reads within +/- 0.3 mg/L of the value of appropriate calibration standard. Need to record DO readings in mg/L and use Table FS 2200-2 "Dissolved Oxygen Saturation". ORP calibration reading must be within +/- 10 mV from the theoretical redox standard value at that temperature.

Field Instrument Turbidity Calibration Records

INSTRUMENT (MAKE/MODEL NO.) HACH 2100 P **INSTRUMENT NO.** HT-5

Project Number: _____ **Project Name:** *LTR*

Standard Vendor: HACH

Prepared Date: AUG 2009 Where Prepared: GOLDER ASSOCIATES

Purchase Date: AUG 2009 Expiration Date: AUG 2011 Lot Number: SEE BELOW

Units:Nephelometric Turbidity Unit

Standard < 0.1 Nephelometric Turbidity Unit LOT # A9212

Standard 20 Nephelometric Turbidity Unit **LOT# A9211**

Standard 100 Nephelometric Turbidity Unit **LOT# A9216**

Standard 800 Nephelometric Turbidity Unit **LOT# A9215**

Calibration values for turbidity needs to be within 10% of the standard for values between 0.1-10 NTU; 8% for values between 11-40 NTU; 6.5% for values between 41-100 NTU and 5% for values >100 NTU.
