Subject: Response to the Florida Department of Environmental Protection's Letter
dated April 25, 1995, Southeast County Landfill, Hillsborough County, Florida
Pending Permit No. S029-256427

Dear Mr. Ford:

On behalf of the Hillsborough County Department of Solid Waste (HCDSW), SCS Engineers (SCS) has reviewed the referenced letter from the Florida Department of Environmental Protection (FDEP). We believe the following responses address the questions raised by the FDEP concerning the operation permit renewal for the Southeast County Landfill (SELF). Each of the FDEP's comments is restated in bold below, and followed by our response.

1. FDEP Statement 1 - Please provide a revised comprehensive Leachate Management Plan (LMP) to include the complete description and sequence of the leachate management system presented in previous sections of the application. Please update these previously submitted sections as necessary. Please include Table 1 and Figure 2 as part of the LMP along with an explanation of the relationship between the two, and describe their use for future compliance. Does Table 1 and Figure 2 indicate leachate will be removed as it is generated? Why is Line B shown on Figure 2 and why does it indicate less hydraulic head without spray irrigation?

Response - Table 1 and Figure 2, from the March 24, 1995 responses to the FDEP, were revised and are included in the Leachate Management Plan (LMP) for the SELF. The LMP was revised to replace Sections 3.3 and 3.4 of the 1994 Operations Permit Renewal Engineering Report. The revised LMP is attached. Table 1 and Figure 2, from the March 24, 1995 response to the FDEP, were compiled using the daily output from the U.S. Environmental Protection Agency's (U.S. EPA) Hydrologic Evaluation of Landfill Performance (HELP) model. The HELP model provides the following daily output; Rainfall (in.), runoff (in.), evapotranspiration (in.), evaporative zone water (in./in.), head (in.), drainage (in.), and leakage (in.).

Because the clay bottom liner will create subsurface flow into the leachate collection and removal system (LCRS), SCS added the leakage amount to the drainage amount to represent the amount of leachate generated. The HELP model is programmed to assume that leachate is removed at the maximum flow rate allowed through the drainage layer. Leachate generation for the SELF was estimated over a 5 year period. Over the five-year simulation, the model calculated an average change in leachate storage in the SELF of 0.12 percent. Therefore, the amount of leachate generated approximately equals the amount collected.

Mr. Kim B. Ford
May 26, 1995
Page 2

The Leachate Collected column in Table 1, from the March 24, 1995 responses to the FDEP, was compiled by adding the leachate generated amounts from the daily output of the HELP model for the wet, dry, and maximum leachate generated years (Refer to Exhibit A to see how the HELP model output data was compiled prior to the creation of Table 1). However, in creating Figure 2 from the March 24, 1995 responses to the FDEP, the daily head amounts were used, not the drainage and leakage amounts.

Since not all of the leachate sprayed over the SELF will evaporate, some moisture will infiltrate the landfill and cause an increase in leachate generation as compared to a simulation without spray irrigation. Line B in Figure 2, was included to show the estimated depth over the liner before the application of spray irrigation. As you requested, Line B is not included in this submittal of the landfill hydrograph.

The only relationships that can be seen between Table 1 and Figure 2, from the March 24, 1995 responses to the FDEP, besides the fact that they were both compiled from the same HELP model runs, is that as shown in Table 1, the dry year (with respect to natural precipitation) was the first year, and the fourth year was the year in which the most leachate was generated. This can be seen in Figure 2 by noticing that the average head for year one was the lowest while the average head for the fourth year was the highest. Table 1 and Figure 2, from the March 24, 1995 responses to the FDEP, can be used as a planning tool for estimated leachate hauling quantities and leachate depth over the liner. The revised LMP for the SELF is attached. Table 1 and Figure 2 from the March 24, 1995 responses to the FDEP, are presented in the revised LMP as Table 2 and Figure 2 respectively.

2. **FDEP Statement 2 - Please provide equations and/or a chart for the quantity of leachate stored for each recorded depth of leachate. Please describe how this equation/chart changes as the top of clay settles. Please identify at least four locations for measuring the top of clay settlement in the vicinity of the future Phase VI sump, three of which may include the two existing sumps and the proposed piezometer location. Please include this information in the revised LMP.**

Response - Figure 3 of the LMP shows a chart that indicates the estimated leachate storage in the SELF using an estimated top of clay elevation of 118.5 feet based on the national geodetic vertical datum. The volume estimated takes into account the porosity and field capacity of the soils.

By establishing a target maximum leachate level in the proposed piezometer of 2.5 feet, as the landfill settles, the sump elevation will become lower and the horizontal extent of leachate will decrease, thus the amount of leachate storage in the SELF will be reduced. As indicated in the LMP, this chart will be adjusted annually to show the best approximation of leachate storage in the SELF.

The top of clay settlement will be monitored at the existing temporary sumps No. 3 and No. 4. In addition, two temporary settling plates will be installed at the locations shown on Figure 4 of the LMP. Leachate levels will be measured daily and the clay elevations will be surveyed semi-annually. The revised LMP for the SELF is attached.

Mr. Kim B. Ford
May 26, 1995
Page 3

3. **FDEP Statement 3** - Please provide the design details for all depth of leachate and top of clay monitoring devices. Please describe the methods and frequencies of all monitoring for the elevations at the top of clay as it settles and the depth of leachate throughout the landfill. Please include this information in the revised LMP.

Response - As stated in the response to the FDEP Statement 1, the leachate depth over the liner will be monitored daily at the proposed Phase IV piezometer (Figure 6 of LMP). As stated in the response to the FDEP Statement 2, the top of clay settlement will be monitored at the existing temporary sums No. 3 and No. 4. The details for the existing temporary sums No. 3 and No. 4 were included in the March 24, 1995 responses to the FDEP. In addition, two temporary settling plates will be installed at the locations shown on Figure 4 of the LMP. The clay elevations will be surveyed monthly and the detail for the proposed settling plates is shown in the LMP on Figure 5. The revised LMP for the SELF is attached.

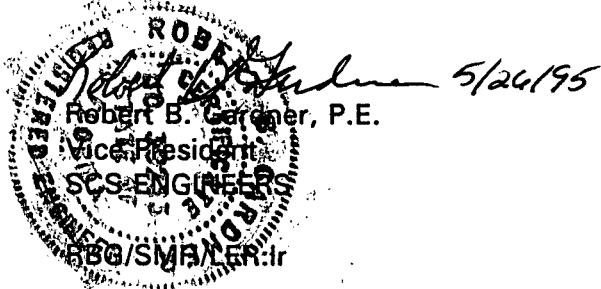

4. **FDEP Statement 4** - Please explain how rainfall is recorded at the landfill. Are past rainfall records at the landfill similar to those valves used in the HELP model? Was recirculation included in the HELP model? What impact will leachate recirculation have on leachate management?

Response - Rainfall currently is being recorded by a weather station located to the north of the administration building. Before 1994, the rainfall data was recorded by SELF personnel; however, as stated on correspondence dated April 28, 1994 (Exhibit B) from the HCDSW to the FDEP, the data was not recorded properly. As shown in Exhibit C, the rainfall data used for the HELP model was a composite of values from the Parrish, Bartow and Plant City weather stations. The composite values used are the best representation of conditions at the SELF. The impact, due to leachate recirculation on daily cover is shown in the revised HELP run included in Exhibit C. The revised LMP for the SELF is attached.

Please do not hesitate to call if you have any questions.

Very truly yours,

Larry E. Ruiz

RE: Southeast Landfill
Permit No. S029-158504
Quantity Report

Dear Mr. Ford:

The Department of Solid Waste (DSW) is submitting the quarterly report for quantities of leachate disposed of at the Southeast County Landfill. A summary sheet for each day is provided along with the quantities of leachate that were disposed of by the County and the Contractor. The leachate was disposed of at a wastewater treatment facility.

The rainfall data that the DSW has previously submitted has been incorrectly reported. The person or persons responsible for the reading of the rain gauges were incorrectly reading the gauges. The DSW is submitting the rainfall data from the Ruskin and Lakeland weather stations as being representative of the Southeast County Landfill rainfall.

The DSW has a computerized weather station at the Southeast County Facility. We are currently awaiting the purchase of a computer modem, so that the information can be downloaded into a computer program. As soon as the data is available, the DSW will provide the Department of Environmental Protection with a copy of the information.

Mr. Kim Ford

EXHIBIT C

CURRENT CONDITIONS "HELP" GENERATION RESULTS

CLIENT Hillsborough County	PROJECT SELF	JOB NO. 0990219.35
SUBJECT HELP Model Simulation of Spray Irrigation	BY Beres P.	DATE 3-14-95
	CHECKED Ras-	DATE 5-19-95

Assumptions:

- 1) Use the same soil & design input parameters from the "calibrated" (50,000 gpd, Draining layer = 0.005 cys, t' waste = 0.0001 cmys).
- 2) Use synthetic temperature & radiation data.
- 3) Use 50 gallons/day/AC Subsurface inflow from confined days (CH2M Hill Hydrogeological/geotechnical report).
- 4) Use the synthetic rainfall data as before (from the "calibrated" model) but include 60,000 gpd of effluent as additional precipitation (0.10" / day) to simulate the spray irrigation, as per specific condition #10.
- 5) Avg wind speed approximated at 7.5 MPH (CH2M Hill Report).
- 6) HELP Model Runs are based on 1 AC areas.
- 7) The landfill will be comprised of 4 parts:
 - 1) Intermediate cap without spray irrigation (69.2 AC)
 - 2) Intermediate cap with spray irrigation (23 AC)
 - 3) Daily Cover Area (5 AC)
 - 4) Sickslopes (2.3.2 AC)
- 8) Assumes 12,200 gpd, leachate recirculation as 0.126" of additional rainfall on 5 acres of daily cover on the 1,309 days in which it did not rain.

$$\text{Total Area} = 120.4 \text{ AC}$$

of

CLIENT H.C.	PROJECT SELF	JOB NO. 0990018.35
SUBJECT HELP model simulation of spray irrigation	BY Baros P. CHECKED LHS	DATE 5-14-95 DATE 3-16-95

Assumptions: (cont.)

- 8) Five year simulations were chosen because that is the length of the permit. The average annual results were used over the five year period when steady state conditions had been approximated (A550).
- 9) The leakage generation rate is represented by the avg. annual drainage collected & the percolation through the soil barrier liner as shown on the annual summary section of the HELP model output.

I. Intermediate cap without spray irrigation
(69.2 AC)

See HELP Model Program Initialization Data Sheet for input parameters (attached)

leakage generated = lateral drainage + leakage (l/sec.)

$$= 20,128 \text{ cft/yr./AC} + 590 \text{ cft/yr./AC}$$

$$\text{Est. Avg. Annual leachate gen.} = 82,300 \text{ gpd} \quad \checkmark$$

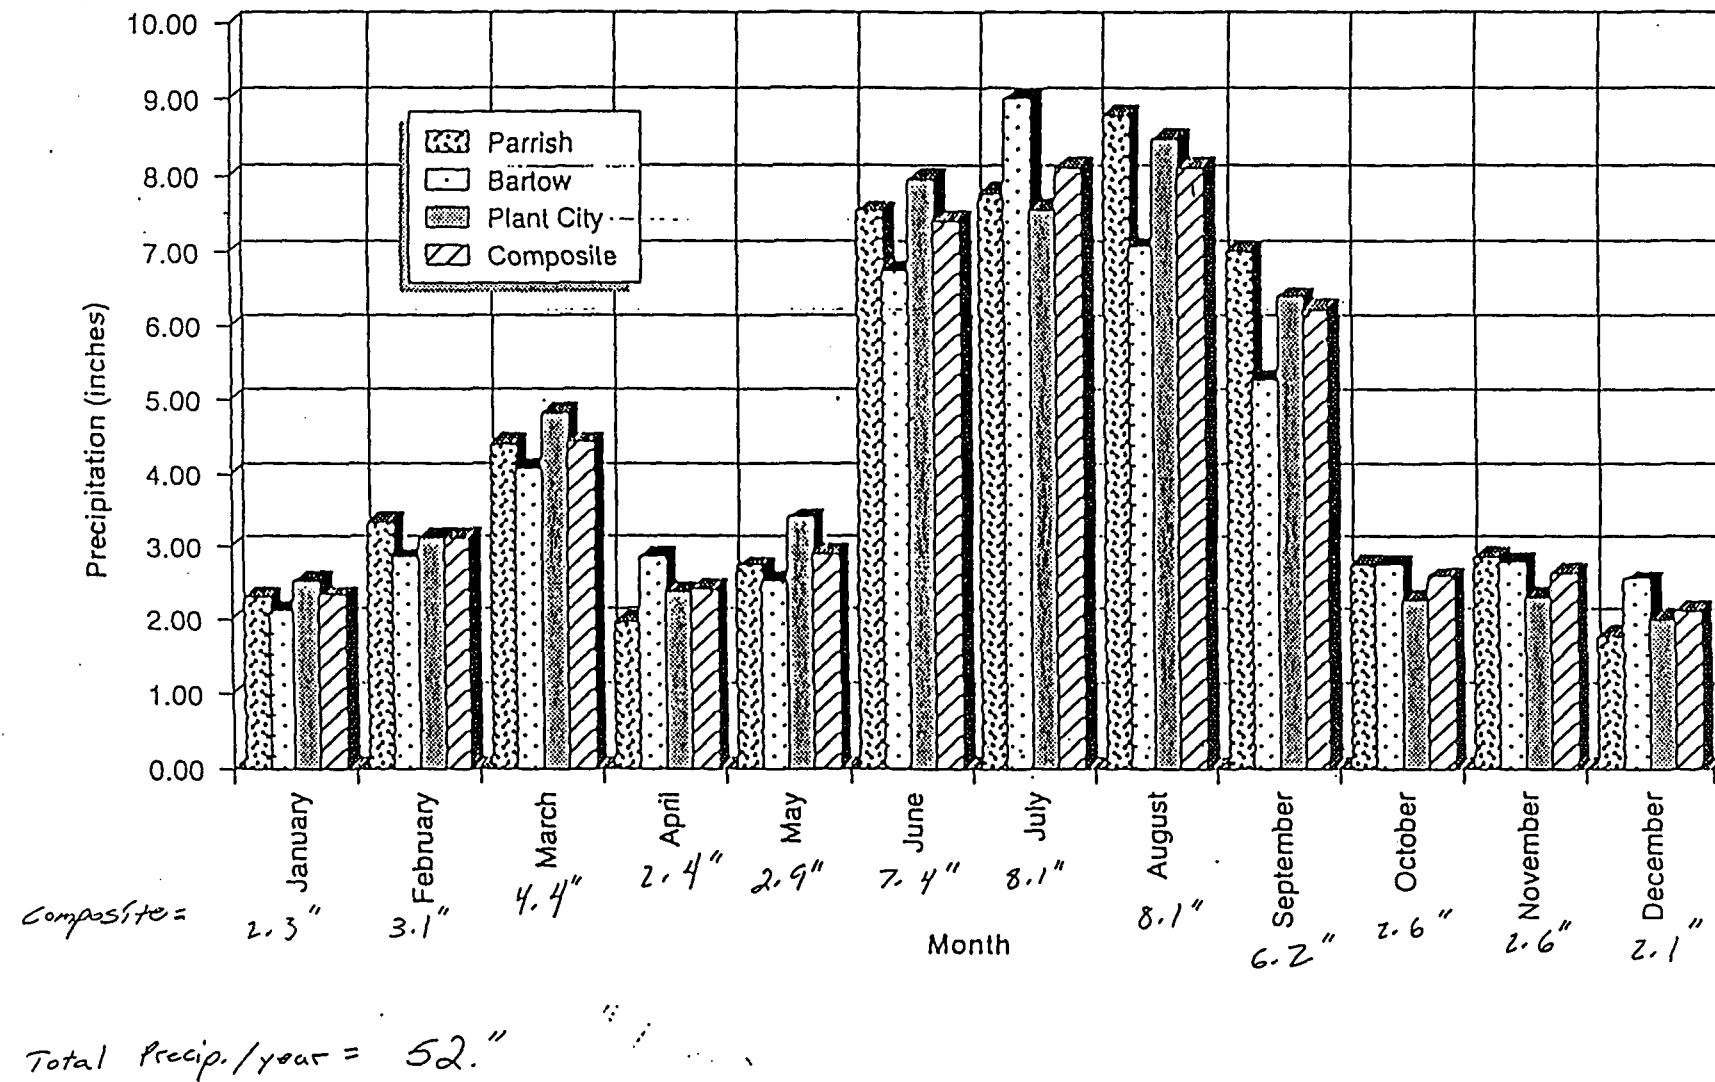

FIGURE 4-4
Precipitation Comparison by Location (1983 - 1992)

The resultant wind direction in the Tampa area is from the north/northeast at an average wind speed of 7.5 miles per hour (mph). The speed and direction, however, can vary significantly throughout the year. During 1992, the maximum observed wind speed (observed for 1 minute or greater) varied from a low of 18 mph during the months of July and October, to a maximum of 29 mph during the months of February and June. The lowest average wind speed occurs during the month of July (5.8 mph), and the highest average wind speed occurs during the month of November (9.1 mph). The highest peak gust measured in 1992 (February) was 45 mph.

Monthly precipitation data collected at the three monitoring stations surrounding the site during the 10-year period from 1983 to 1992 are presented in Figure 4-4 along with a "composite" of the data, which represents the average precipitation at the three stations. This composite should provide a representative value of the monthly precipitation expected at the new Class I landfill site. The average monthly precipitation varies from a low of 2.10 inches during December to a high of 8.12 inches during July. Figure 4-5 shows a comparison of the precipitation data collected at the existing Hillsborough County Southeast Landfill to the composite data. The monthly rainfall collected at the existing facility, which is adjacent to the proposed new Class I landfill site, during the 7-month period reported was abnormally high in comparison to the expected monthly rainfall. Rainfall at the facility was more than double the expected value during the month of August, 1993, and total precipitation measured during the 7-month period was more than 30 percent higher than the total expected rainfall for an entire year.

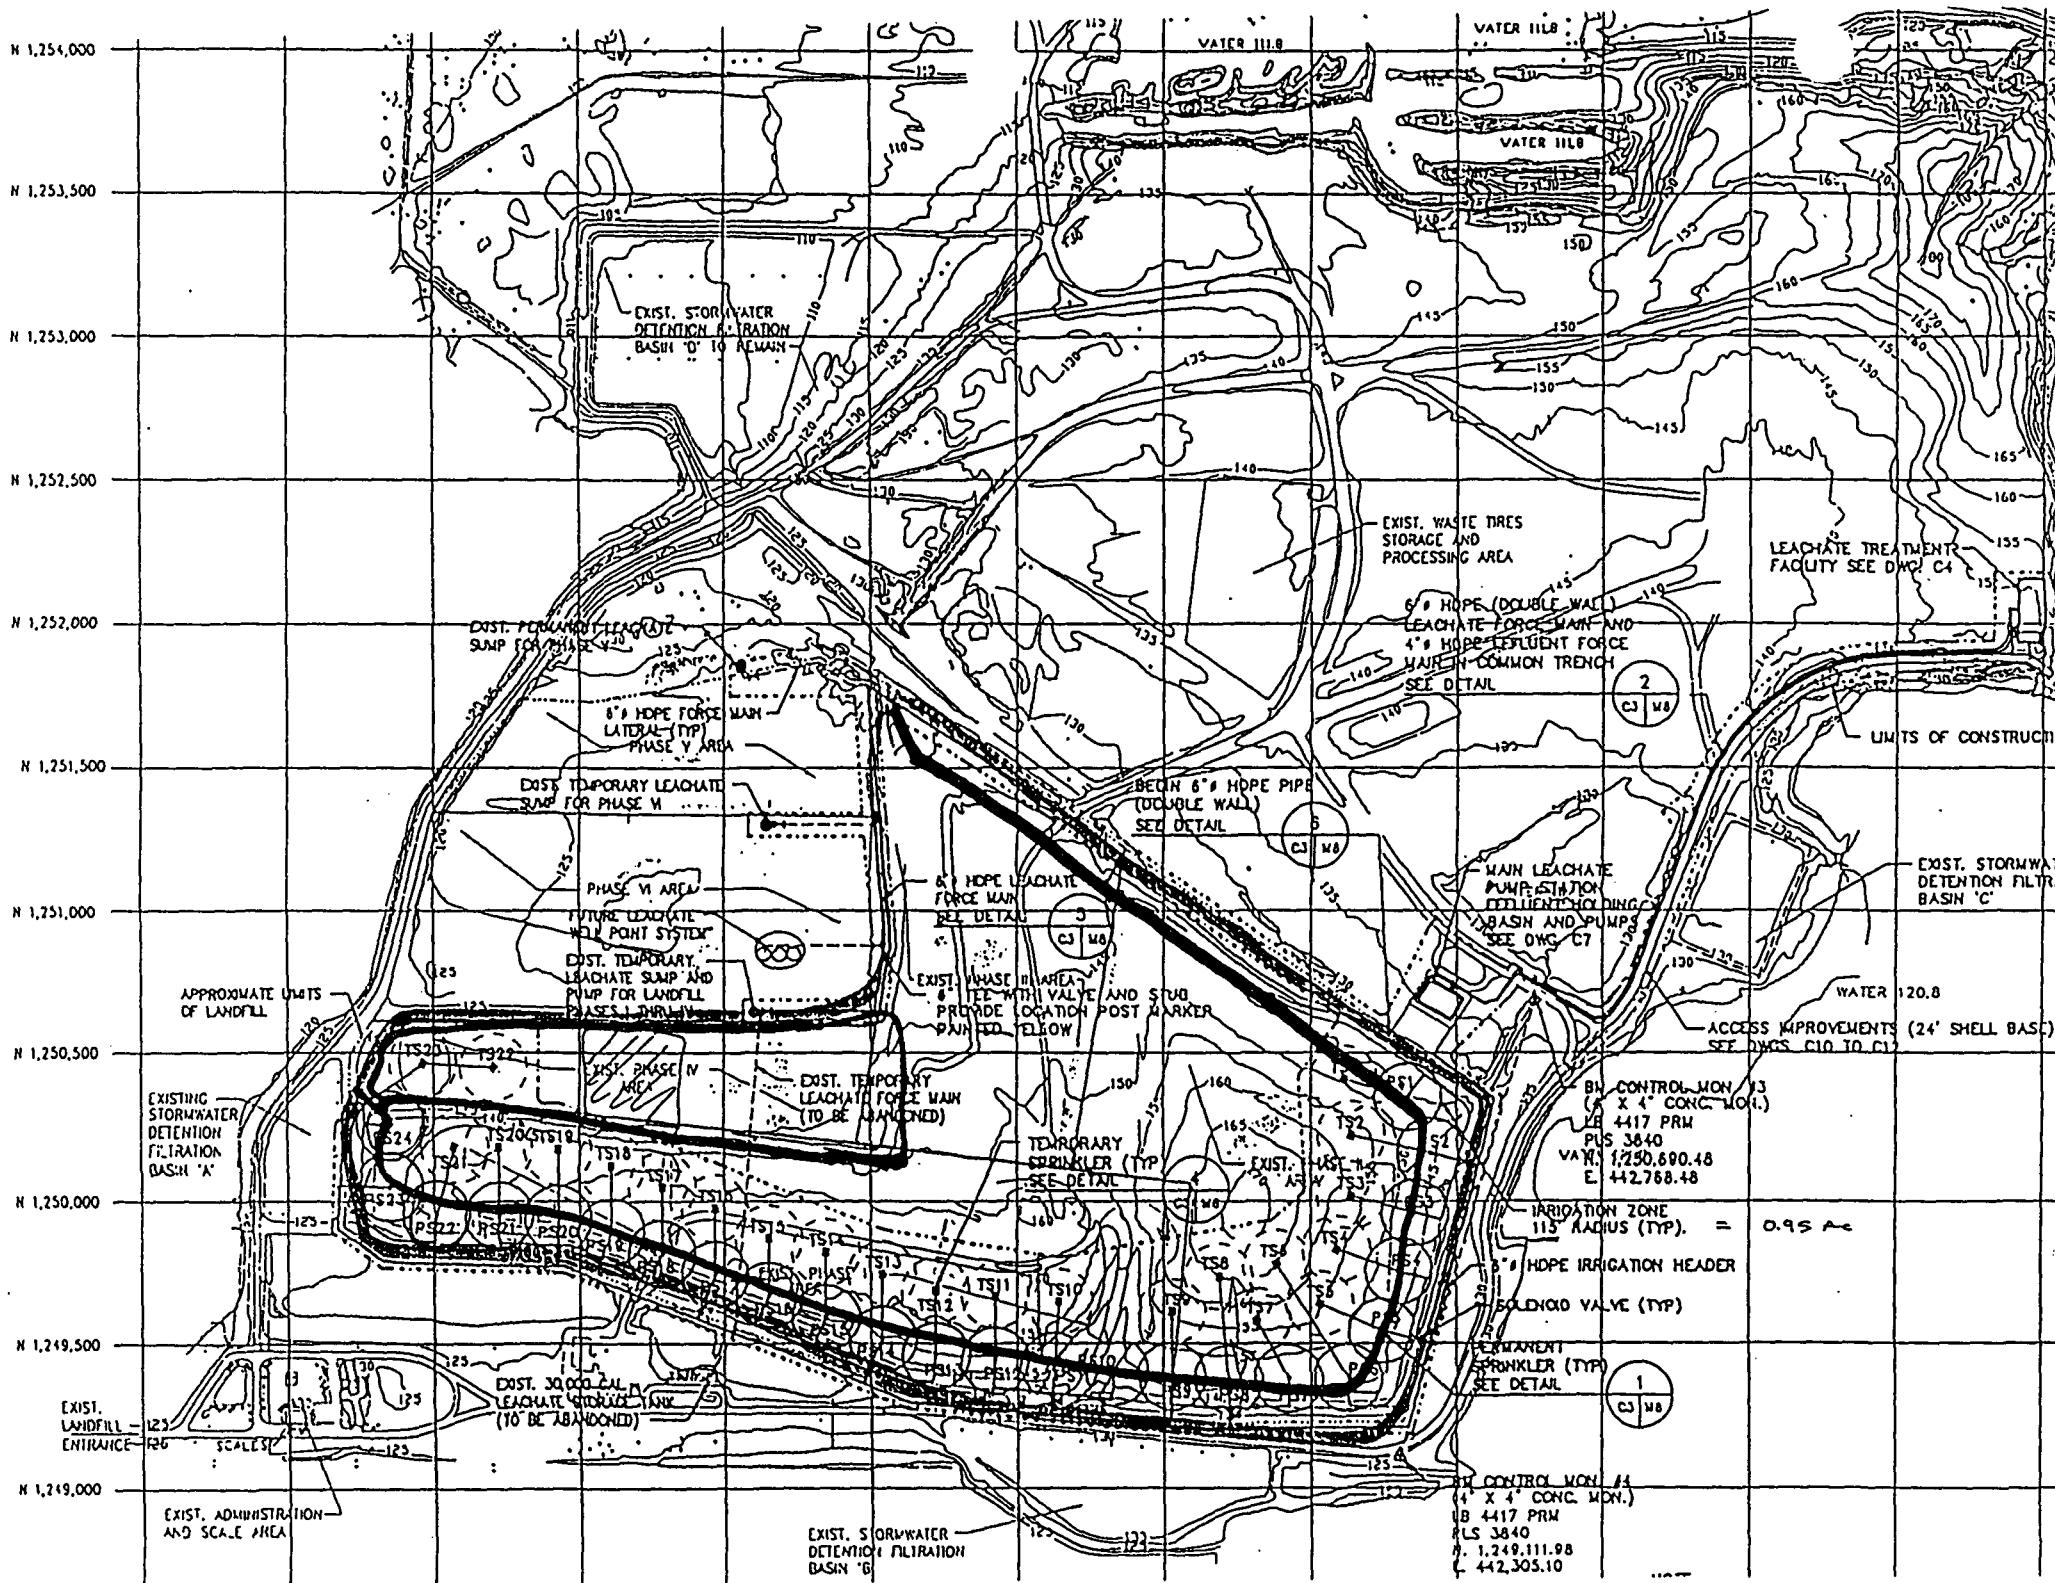

Monthly average pan evaporation data collected from the Lake Alfred Experimental Station is provided in Figure 4-6. Evaporation for the period from 1983 through 1992 varied from an average low of 3.60 inches during December to an average high of 9.36 inches during May.

Soils Series

A review of the published soil data prepared by the United States Soil Conservation Service (SCS) was conducted for the immediate vicinity of the site (Doolittle, et al., 1989). Within the footprint of the proposed municipal solid waste disposal area, only two major soil groups were identified by the SCS. These consist of the Arents soil series and the Haplaquents soil series (Figure 4-7).

The Haplaquents (No. 51), clayey soil series consist of nearly level and very poorly drained, fine textured materials deposited as a result of phosphate mining activities (clay settling ponds). This is the predominant soil series within the proposed municipal solid waste disposal area, and is the result of past phosphate mining activities. Typically, the depth of this soil group can range from about 3 feet to more than 30 feet. These soils contain approximately 88 percent clay, 8 percent silt, and 4 percent sand. The clay is primarily montmorillonite, but also contains kaolinite and illite.

The Arents soil series (No. 4), consists of nearly level heterogeneous materials that have been excavated, reworked and reshaped by earth moving equipment. Arents are near urban centers,

SHEET 1 OF 1

CLIENT H.C.	PROJECT Southeast Landfill	JOB NO. 0992018.35
SUBJECT Day Cover Recirculation	BY Feres P. CHECKED	DATE 5-2-95

Daily Cover Area = 5 AC

Average Recirculation Rate = 12,200 gpd

There are 1,309 days with no rain.

There are a total of 1,850 days being simulated.

How many inches of rain need to fall on 1,309 days to equal 12,200 gpd?

Total Volume:

$$\frac{12,200 \text{ gallons}}{\text{day}} \times 1,850 \text{ days} = 22,570,000 \text{ gallons}$$

7.481 gallons/CF

Flow rate over 1,309 days

$$\frac{22,570,000 \text{ gallons}}{1,309 \text{ days}} = 17,242 \text{ gpd}$$

17,242 gallons	1 AC	1SF	12 in
day	5 AC	43,560 SF	7.481 gallons/1 ft

= 0.126" show 0.126" of rainfall on the 1,309 days in which it does not naturally rain.
