Re: **Southeast County Landfill – Section 7**
Analytical Data - TH-59, TH-60, and Leak Detection System

Dear Mr. Morris:

The Hillsborough County Solid Waste Management Department (SWMD) is pleased to provide the analytical data from the detection wells TH-59, TH-60, and the Section 7 Leak Detection System (LDS) at the Southeast County Landfill (SCLF).

As discussed in the August 2004 ADR for the SCLF, which was submitted on November 3, 2004, the SWMD collected samples from the referenced locations on November 9, 2004. These samples were collected as follow up assessment activities in response to the analytical results from October 6 and 14, 2004 sampling of these data points. Those results indicated the presence of benzene and chlorinated solvents above their maximum contaminant level (MCL). Each of the detection wells and the LDS were sampled by the SWMD Field Sampling Team, and the samples were transported to our contracted laboratory on November 9, 2004. SCS Engineers also collected samples from these locations and sent them to an independent laboratory for additional quality control and assurance. Each set of samples collected was analyzed by the two laboratories for EPA Method 8260 and the major cations and anions. Additional analyses for a number of metals were run on the SWMD's samples. The analytical data set generated from this split sampling effort by the SWMD and SCS is discussed in detail herein.

Analytical Data – SWMD Samples

The SWMD collected groundwater samples from TH-59, TH-60, and sampled the LDS on November 9, 2004 for the above-referenced parameters. A number of parameters were observed above the State of Florida Primary Drinking Water Standard (PDWS), Secondary Drinking Water Standards (SDWS) (FAC Ch 62-550.310-.320), and the Florida Groundwater Cleanup Target Levels (GCTL) (FAC Ch 62-777).

Mr. John Morris, P.G.

December 20, 2004

Page 2

The parameters observed above their respective MCLs in TH-59 were benzene at 5.4 ug/l, sulfate at 300 mg/l, iron at 8.6 mg/l, manganese at 0.32 mg/l, nickel at 0.12 mg/l, aluminum at 0.2 mg/l, and pH at 5.61 pH units. Parameters detected above their MCLs in TH-60 were benzene at 3.8 ug/l, sulfate at 400 mg/l, iron at 12 mg/l, manganese 0.5 mg/l, nickel at 0.19 mg/l, aluminum at 0.58 mg/l, and cadmium at 0.0071 mg/l. The value for pH was 5.59 pH units, which is below the SDWS acceptable range for pH.

The SWMD collected a sample from the LDS and the results indicated a number of parameters exceeding standards. These parameters included benzene at 5.4 ug/l, chloride at 490 mg/l, iron at 100 mg/l, manganese at 2.2 mg/l, 1,2-dichloroethane at 3.4 ug/l, methylene chloride at 5.8 ug/l, and pH at 6.27 pH units.

Analytical Data – SCS Samples

SCS Engineers collected groundwater samples from TH-59 and TH-60, and also sampled the LDS on November 9, 2004. The samples were analyzed for organics and major cations and anions. A number of parameters were observed above the State of Florida Primary Drinking Water Standard (PDWS), Secondary Drinking Water Standards (SDWS) (FAC Ch 62-550.310-.320), and the Florida Groundwater Cleanup Target Levels (GCTL) (FAC Ch 62-777). TH-59 exhibited benzene at 2.8 ug/l, and iron at 8.8 mg/l. TH-60 exhibited benzene at 1.7 ug/l, sulfate at 304 mg/l, and iron at 12 mg/l. A number of other metals and organic parameters were detected in the groundwater samples below their applicable MCL's.

SCS Engineers collected a sample from the LDS and the results indicated a number of parameters exceeding standards. The parameters observed above standards include benzene at 3.3 ug/l, 1,2-dichloroethane at 3.3 ug/l, sulfate at 420 mg/l, and iron at 160 mg/l,. A summary table of the two sets of analytical results is provided within this report.

Evaluation of Data

The data generated to date has been thoroughly evaluated by the SWMD and SCS Engineers. Comparative analyses of the groundwater and the leachate collected from the LDS has been performed, and stiff diagrams have been prepared for the two wells and the LDS by SCS Engineers. These diagrams, which are provided in the attached letter report from SCS, support the position that the contaminants observed in the two detection wells are not associated with the contaminants observed within the LDS.

Conclusions

After carefully reviewing the water quality from the initial and supplemental sampling events, it appears that the contaminants observed in the two detection wells, TH-59 and TH-60, are of a

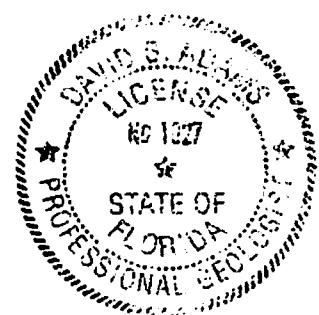

Mr. John Morris, P.G.
December 20, 2004
Page 3

different origin than the contaminants collected from the LDS. The stiff diagrams provided within the SCS Letter Report depict that ionic concentrations of the major cations and anions are different within the groundwater collected from TH-59 and TH-60 when compared to the LDS. This evaluation along with our previous discussions about groundwater velocities at the site and the travel time since initiation of waste filling activities, indicate that the contaminants in the groundwater are not likely the result of a liner system failure.

The SWMD is continuing to make every effort to determine the source of impacts to the groundwater in TH-59 and TH-60. In response to the latest groundwater quality, the SWMD collected twenty-five (25) soil samples in the vicinity of the two wells on December 15, 2004. Nineteen soil samples were collected from the upper 1 foot of soils along the eastern side of the adjacent access road, the ramp up to Section 7, and along the top of the northwestern side of the Section 7 cell. The remaining six (6) samples were collected in the direct vicinity of TH-59 and TH-60. Three samples were collected from each boring location at depths of 6-inches, one-foot, and two feet below land surface (bls). These soil samples will be analyzed by EPA Method 8260, chlorides, sulfides, aluminum, cadmium, iron, manganese, nickel, and vanadium to determine if there are any surficial impacts that could affect groundwater quality. A map depicting the 25 soil sample locations are attached within this report. A report will be generated and submitted to the Florida Department of Environmental Protection (FDEP) after the soil sample analysis has been completed.

Enclosed for you review, please find a site map, a water quality summary table, the letter report from SCS Engineers containing the stiff diagrams, a map of the soil sample locations, and the complete laboratory analytical data sheets. Should you have any questions or comments concerning the information provided in this submittal, please feel free to contact David Adams at (813) 276-2944.

Sincerely,
David S. Adams 12/20/04

Subject: Split Sampling and Stiff Diagram Evaluation for the Southeast County Landfill,
Hillsborough County, Florida

Dear Dave:

On November 9, 2004 Hillsborough County Solid Waste Department (HCSWD) and SCS Engineers (SCS) collected split water quality samples, with Hillsborough County staff, from selected monitoring locations at the Southeast County Landfill (SELF). Samples were collected through dedicated pumps from monitoring wells TH-59, TH-60, and the leak detection system of Section 7. Samples were analyzed, by separate laboratories, for the major cations (sodium, potassium, calcium, magnesium, and iron), the major anions (chloride, bicarbonate alkalinity, carbonate alkalinity, and sulfate), and Environmental Protection Agency (EPA) Method 8260 for volatile organic compounds (VOCs).

Table 1 presents SCS' summary of detected parameters from the November 9, 2004 sampling event. Tables 2, 3, and 4 presents a summary of detected parameters at each sampling location (TH-59, TH-60, and the leak detection system) from the initial sampling event (October 6, 2004) and the subsequent resampling events (October 14 and November 9, 2004), as performed by HCSWD. These tables indicate that during the October 6, 2004 sampling event benzene was exceeding the Florida Administrative Code (F.A.C.) Chapter 62-550 primary drinking water standard (PDWS) of 1 microgram per liter (ug/l) of benzene in monitoring wells TH-59 and TH-60. HCSWD resampled monitoring wells TH-59 and TH-60 on October 14, 2004, and laboratory analytical results indicated an PDWS exceedence of benzene in TH-59 and TH-60. Additionally, the leak detection system was sampled on October 14, 2004 and laboratory analytical results indicated that PDWS were exceeded for benzene, 1,2-dichloroethane, methylene chloride, and trichloroethene. Laboratory analytical results from the November 9, 2004 sampling event indicate that sulfate and iron were exceeding the F.A.C. Chapter 62-550 secondary drinking water standards (SDWS) of 250 mg/l and 0.3 mg/l, respectively, and the PDWS for benzene in monitoring wells TH-59 and TH-60. Additionally, the leak detection system was exceeding SDWS for chloride and iron of 250 mg/l and 0.3 mg/l, respectively, and the PDWS for benzene, 1,2-dichloroethane, and methylene chloride.

SCS evaluated the analytical data by comparing ionic concentrations of major cations and anions found in the surficial aquifer and the leak detection system. Stiff diagrams are one variety of ion-concentrations graphs that visually represent quality of water at a particular location with respect to select inorganic parameters. Each Stiff diagram shows a figure

Mr. David Adams, P.G.
December 10, 2004
Page 2

obtained by connecting concentration values of nine inorganic dissolved constituents with sodium and potassium summed for one of the values. Each figure is constructed using a split horizontal scale with concentrations of cations shown on the left side of the figure and concentrations of anions shown on the right side of the figure. All concentrations are in milliequivalents per liter (meq/l). Table 5 presents the conversion table for the cation and anions from milligrams per liter (mg/l) to meq/l. Resulting figures can be compared to find similar types of water quality which are represented by similarly shape figures. Dilution or concentration of a particular water quality reduces or increases, respectively, the size of the figure but does not substantively change its basic shape.

Figure 1 presents the stiff diagrams for monitoring wells TH-59, TH-60 and the leak detection system. The Stiff diagrams for TH-59 and TH-60 are relatively similar, and their cation/anion ratios are similar. It is concluded that the shapes of these diagrams are representative of surficial aquifer groundwater quality with respect to ionic species. These shapes can be compared to the Stiff diagram for leak detection system. The Stiff diagram for the leak detection system is noticeably different than those that represent the surficial aquifer groundwater (TH-59 and TH-60). It is concluded that the groundwater present in the leak detection system is not the same groundwater present in the surficial aquifer. Consequently, the source for the VOCs in the monitoring wells appears to not be related to the VOCs found in the leak detection system.

Please call if you have any questions or require additional information.

Sincerely,

Ken E. Guilbeault

Figure 1. Stiff Diagram, Southeast County Landfill, Hillsborough County, Florida

HILLSBOROUGH COUNTY
SOLID WASTE MANAGEMENT DEPARTMENT
SOIL SAMPLING LOCATIONS
DECEMBER 15, 2004

Aerial photograph showing a large industrial facility, possibly a landfill or waste management site, with several sampling locations marked by yellow dots and labeled with codes. The facility is surrounded by roads and greenery. The sampling locations are distributed across the site, with concentrations in the central and southern areas.

Re: **Southeast County Landfill – Section 7**
Analytical Data - TH-59, TH-60, and Leak Detection System

Dear Mr. Morris:

The Hillsborough County Solid Waste Management Department (SWMD) is pleased to provide the analytical data from the detection wells TH-59, TH-60, and the Section 7 Leak Detection System (LDS) at the Southeast County Landfill (SCLF).

As discussed in the August 2004 ADR for the SCLF, which was submitted on November 3, 2004, the SWMD collected samples from the referenced locations on November 9, 2004. These samples were collected as follow up assessment activities in response to the analytical results from October 6 and 14, 2004 sampling of these data points. Those results indicated the presence of benzene and chlorinated solvents above their maximum contaminant level (MCL). Each of the detection wells and the LDS were sampled by the SWMD Field Sampling Team, and the samples were transported to our contracted laboratory on November 9, 2004. SCS Engineers also collected samples from these locations and sent them to an independent laboratory for additional quality control and assurance. Each set of samples collected was analyzed by the two laboratories for EPA Method 8260 and the major cations and anions. Additional analyses for a number of metals were run on the SWMD's samples. The analytical data set generated from this split sampling effort by the SWMD and SCS is discussed in detail herein.

Analytical Data – SWMD Samples

The SWMD collected groundwater samples from TH-59, TH-60, and sampled the LDS on November 9, 2004 for the above-referenced parameters. A number of parameters were observed above the State of Florida Primary Drinking Water Standard (PDWS), Secondary Drinking Water Standards (SDWS) (FAC Ch 62-550.310-.320), and the Florida Groundwater Cleanup Target Levels (GCTL) (FAC Ch 62-777).
