COMMENTS:

04/10/2013

Class I Landfill:

The class I working face is located on the southeast side of phase I, area 2 of the North Cell. Disposal is moving towards the south. Since moving to area 2, the facility has worked in a north/south pattern creating new lifts when reaching each end of the cell area.

There is excessive waste protruding through the cover in the areas of previous disposal north of the current working face. On April 22, Jennifer Stirk submitted pictures showing the application of additional cover over the exposed waste.

In accordance with DEP closure permit no. SF64-0078767-028, the facility is relocating waste and regrading the terraces on the west side slopes of area 1 to meet the correct closure elevations for these slopes. Jennifer Stirk said that the work will next shift to the south side slopes.

During the past few inspections, leachate seepage on the south side slopes accumulated within a toe berm designed to contain leachate before it was collected by a toe drain system. At the time of inspection, there was no leachate seepage on the south side slopes and no standing leachate within the within the toe berm. The facility continues to have a pump in place in case the leachate seepage returns. The partial closure of the south side slopes will extend the toe drain system along the length of the side slopes and fill in the containment berm area.

Class III Landfill and Yard Trash Area:

The class III working face is located on the south side slopes. Jennifer Stirk said the facility moved to this area within the week prior to the inspection. The facility was covering areas of the previous working face area on the southwest corner.

The yard trash area was in good order at the time of inspection.

Item No 1.7 marked unknown: The water quality report is reviewed as a separate function and is not deemed part of this inspection report.
