## 1 INTRODUCTION

SCS Engineers (SCS) prepared this technical water quality monitoring report for the Vista Landfill (VLF) on behalf of Vista Landfill, Inc. (VLI). The VLF is located approximately two miles south of Apopka, Florida, at 242 West Keene Road. The VLF lies south of Keene Road, west of Old Apopka-Clarcona Road, and east of Lake Mitchell in Orange County, Florida (Figure 1-1). The VLF is a Class III lined landfill with a leachate collection system. The bottom-liner system consists of three layers (from top to bottom): a 2-foot thick sand liner protective layer, a double-sided geocomposite drainage layer, and a 50-mil high density polyethylene (HDPE) geomembrane layer. Waste was initially placed in the landfill on November 17, 2008.

This report was prepared in general accordance with Florida Department of Environmental Protection (FDEP) Permit/certification No. SO48-0165969-20, Condition 26, Monitoring Plan Implementation Schedule (MPIS), and Chapter 62-701.510(9)(a) Florida Administrative Code (FAC). This report includes a summary and evaluation of the groundwater and leachate analytical data from monitoring events performed at the VLF from June 2011 through the most recent monitoring event, June 2013. Locations of monitoring sites are shown on Figure 1-2. The following lists the specific data and information included in this report.

- Tabular and graphical displays of data that show that a monitoring parameter has been detected, including hydrographs for monitoring wells water levels.
- Trend analysis of monitoring parameters detected.
- Comparison among shallow, middle, and deep zone wells.
- Comparison between up-gradient and down-gradient wells.
- Correlation between related parameters such as total dissolved solids and specific conductance.
- Discussion of erratic and/or poorly correlated data.
- An interpretation of the groundwater contour maps, including an evaluation of groundwater flow rates.
- An evaluation of the adequacy of the water quality monitoring frequency and sampling locations based upon site conditions.

Water quality sampling and physical readings and measurements were performed by technical staff of Pro-Tech Environmental (Pro-Tech), Atlanta, Georgia. Water quality analyses were performed by TestAmerica Laboratories, Inc. (TestAmerica Denver), Denver, Colorado. Field work, sampling methodologies, data evaluation, data Quality Assurance/Quality Control (QA/QC) were conducted in accordance with FAC Chapter 62-160 Standard Operating Procedures (DEP-SOP-001/01), the VLF MPIS, the VLF site permit, and the Pro-Tech sample

team quality manual. Laboratory analyses were performed in accordance with Chapter 62-160, FAC DEP-SOP-001/01, the BRL WQLMP, and the site permits. TestAmerica-Denver is certified by the Florida Department of Health Environmental Laboratory Certification Program (DoH ELCP).

## 2 GEOLOGIC AND HYDROGEOLOGIC CHARACTERISTICS

Figure 1-1 shows the topography of the VLF site and region prior to the site being developed as a borrow pit and then as a landfill. The topography indicates the site is located in a region that is internally drained.

Based on SCS' evaluation of the VLF hydrogeologic data, the groundwater at VLF primarily occurs in the Hawthorn Group and the underlying Floridan aquifer. The "surficial aquifer" consists of the water-bearing permeable zones of the Hawthorn Group that overlay the Floridan aquifer. The groundwater flow direction of the upper Hawthorn Group tends to mimic the pre-construction topography of the VLF. As seen on Figure 1-1, the topography of the VLF (Figure 1-1) generally slopes towards the north, west, and south.

The Floridan aquifer underlies the surficial aquifer at the KRL and is separated from it by the clay units of the Hawthorn Group.<sup>1</sup> Karst features (e.g., sinkholes) developed historically in the sediments overlying the upper Floridan aquifer, producing the internal drainage characteristics of the region. As a result, runoff and surficial aquifer groundwater flow moves toward and into these karst features, often resulting in the development of surface water bodies such as Lake Mitchell, which is located west of the VLF (Figure 1-1).

For this technical report, SCS performed groundwater flow assessment of the surficial aquifer for the period extending from June 2011 through June 2013. The activities included compiling groundwater depth measurements, calculating groundwater elevations, and plotting the data onto site figures to assess groundwater flow direction. Water level maps generated for the upper surficial aquifer (also referred to as the shallow surficial aquifer) and lower surficial aquifer (also referred to as the intermediate surficial aquifer) are presented in Appendix A. These maps are generated using the Surfer® Version 10 groundwater contouring computer program, with the interpretation verified by an SCS hydrogeologist.

### Upper Surficial Aquifer

The upper surficial aquifer is defined as the uppermost water-bearing zone of the undifferentiated sands and clayey sands that are part of the Hawthorn Group. Water table maps of this aquifer were prepared by SCS from surficial aquifer well data for each of the sampling events (Figures A-1 through A-5, Appendix A). Groundwater flow typically is perpendicular to the water level contours. Therefore, the approximate direction of groundwater flow in the upper surficial aquifer is to the southwest. This groundwater flow configuration results from a combination of recharge from rainfall infiltration outside the bottom liner, interchange of groundwater with the underlying intermediate surficial aquifer, and lateral inflow to the shallow surficial aquifer from outside the VLF.

---

<sup>1</sup> The Rust Environment and Infrastructure (RUST) August 1996 (Revised September 1998) report entitled "Keene Road Hydrogeologic Evaluation" Prepared for Waste Management Inc.

Groundwater velocities along typical gradients within each flow regime shown on Figure A-5 (the most recent water level map) were calculated from average gradient estimated from the Figure A-5 of 0.020 feet/foot and hydraulic conductivity value reported in a 2004 permit application for VLF<sup>2</sup> of 1.03 ft/day. Based on lithology, the porosity is estimated to be approximately 0.3.

The velocity of groundwater in the surficial aquifer beneath the site was calculated using a form of Darcy's law<sup>3</sup>,  $V = k(dh/dl)/\theta$ , where:

- $V$  is the average velocity of groundwater (ft/day).
- $k$  is the aquifer horizontal hydraulic conductivity (ft/day).
- $dh/dl$  is the aquifer hydraulic gradient (ft/ft).
- $\theta$  is the effective porosity of the aquifer (unitless).

The velocity in the surficial aquifer is approximately 25 feet/ year.

Based on the lithologic descriptions of the surficial aquifer of the VLF, the 1.03 ft/day hydraulic conductivity reported in the 2004 permit application appears to be representative of the VLF. Todd<sup>4</sup> reports that a typical value for a silty aquifer is approximately 0.08 meters per day (0.02 ft/day) and clayey aquifers have even lower hydraulic conductivities. Descriptions of the surficial aquifer lithology of the PRL include silty sands and clayey sands, indicating the effective horizontal conductivity of the surficial aquifer is consistent.

### **Intermediate Surficial Aquifer**

The intermediate surficial aquifer is defined as the lower water-bearing zone of the undifferentiated sands and clayey sands that are part of the Hawthorn Group. Water table maps of this aquifer were prepared by SCS from intermediate surficial well data for each of the sampling events (Figures A-6 through A-10, Appendix A). Groundwater flow within the intermediate surficial aquifer beneath the VLF apparently consists of multiple flow configurations, as indicated by the groundwater flow direction arrows on Figure A-10. Groundwater entering from the site's western boundary flows east and northeast towards a slight hydraulic depression on the site's northern boundary. A portion of the groundwater enters near the northeast corner and moves to the south and southwest. This groundwater flow configuration is caused by a contrast of groundwater flow conditions from the overlying shallow surficial aquifer and lateral inflow from the intermediate surficial aquifer from outside the VLF.

### **Floridan Aquifer**

Due to the limited number of "FL" zone wells for the site, potentiometric maps were not prepared for the Floridan aquifer. Regional potentiometric maps for the Floridan aquifer indicate

<sup>2</sup> Bishop & Buttrey, Inc., May 2004 report titled "Application for Keene Road Disposal Class III Landfill Expansion"

<sup>3</sup> Lohman, S. W., "Ground-Water Hydraulics." Geological Survey Professional Paper 78, 1972, pp.10-11.

<sup>4</sup> Todd, David Keith. Groundwater Hydrology. John Wiley & Sons, Inc., New York. 1980, p. 71.

that flow in the aquifer at the VLF is towards the northeast. This is confirmed by the water levels observed at the VLF at Floridan aquifer groundwater monitoring wells MW-FL1 and MW-FL3 (see Figure A-13, Appendix A).

### Aquifer Hydraulic Relationships

Updated hydrographs depicting the groundwater elevations within each well for each sampling event over the monitoring period are included in Appendix A. Hydrographs are included that show the elevations of water levels over time for:

- Clusters of monitoring wells to show vertical relationships between potentiometric head levels.
- Upper surficial aquifer and lower surficial aquifer wells.

There are seven well pairs that were used to provide data for the comparison of the upper surficial aquifer to the lower surficial aquifer on the site, and one well pair that was used to provide data for the comparison of the lower surficial aquifer to the Floridan aquifer as listed below. Hydrographs for these well pairs can be used to assess the potential for vertical flow of groundwater between the upper and lower surficial aquifers for wells located in pairs. The presence of an upward or downward gradient between well pairs does not indicate flow between the wells, but demonstrates the different potentiometric heads and the potential for flow.

**Table 2-1. Vertical Hydraulic Pairs  
at the Vista Landfill**

Vertical Hydraulic Pairs			
Vertical Pair (Lower/Upper)	Location	Difference in Potentiometric Levels During June 2013	Gradient Direction
MW-1B/MW-1A	Northeast	11.52	Upward
MW-2B/MW-2AR	North Center	1.35	Downward
MW-3B/MW-3A	South Center	0.01	Upward
MW-FL1/MW-3B	South Center	0.01	Upward
MW-4B/MW-4A	South Center	1.04	Upward
MW-5B/MW-5A	Southeast	4.02	Downward
MW-6BR/MW-6AR	West	0.01	Upward
MW-7B/MW-7A	East Northeast	12.79	Downward

### 3 WATER MONITORING PROGRAM

The water monitoring program consists of monitoring the surficial aquifer groundwater, Floridan aquifer groundwater, and leachate (December 2011). E-mail correspondence dated September 25, 2012, from Kim Rush, FDEP, granted approval to remove annual leachate sampling and analysis from the site requirements per the Chapter 62-701, FAC, rule change. Leachate sampling was terminated accordingly.

Across the Vista Landfill, the surficial and Floridan aquifer groundwater currently are monitored at eighteen locations. The surficial aquifer is monitored in two zones: the shallow zone (“A” wells) and the intermediate zone (“B” wells). The Floridan aquifer is monitored by the “FL” wells, with the exception of MW-FL2R. Based on well logs and similar water levels to surficial aquifer intermediate zone wells, MW-FL2R appears to be installed in a deep portion of the surficial aquifer deep zone, possibly in a relict karst feature.

Well locations for each monitored zone are shown on Figure 1-2. The monitoring wells and respective aquifers for each monitored zone are listed in Table 3-1. The construction details for the eighteen active wells comprising the monitoring system are included in Table 3-2.

Notes:

1. Survey Information was obtained from the May 25, 2007 Geosyntec Consultants Environmental Monitoring Location Map.
2. Well construction information obtained from the July 2004, Collinas Group, Inc., Groundwater Monitoring Well Installation Report, Buttrey Landfill Parcel.
3. Well construction information obtained from the March 15, 2007, Professional Service Industries, Inc., Monitoring Well Completion and Well Abandonment Report.
4. NGVD = National Geodetic Vertical Datum of 1929.
5. NAD 1983 = North American Datum of 1983.
6. WACS = State Water Assurance Compliance System.
7. BLS = Below Landsurface.
8. NA = Not Applicable.
9. BG = Background.
10. CO = Compliance.
11. ND = Data not available.
12. OT = Other.
13. ID = Identification.

The current permit requires semi-annual sampling of the background and compliance monitoring wells for the field and laboratory parameters listed below.

#### **Field Parameters**

- Static water level before purging
- Specific conductivity
- pH
- Dissolved oxygen
- Turbidity
- Temperature
- Color and sheens by observation

#### **Laboratory Parameters**

- Total ammonia-nitrogen
- Chlorides
- Iron
- Mercury
- Nitrate
- Sodium
- Total dissolved solids (TDS)
- Parameters listed in 40 CFR (Code of Federal Regulations) Part 258, Appendix I

#### **Additional Parameters**

During the initial background monitoring event prior to the placement of waste, some parameters exceeded the Primary Drinking Water Standards (PDWS) or Secondary Drinking Water Standards (SDWS) as listed in Chapter 62-550, FAC. These included the following parameters, which were added to the semi-annual monitoring:

- Aluminum
- Gross Alpha
- Manganese

Semi-annual reporting of the groundwater sampling results is performed in accordance with the VLF MPIS.

### **LEACHATE MONITORING PROGRAM**

E-mail correspondence dated September 25, 2012, from Kim Rush, FDEP, granted approval to remove annual leachate sampling and analysis from the site requirements per the Chapter 62-701, FAC, rule change. Leachate sampling was terminated accordingly. The December 2011

Leachate was monitored at the site at the leachate storage tank (L-1). The permit required the annual sampling of L-1 for the field and laboratory parameters listed below.

### Field Parameters

- Specific conductivity
- pH
- Dissolved oxygen
- Turbidity
- Temperature
- Color and sheens by observation

### Laboratory Parameters

- Total ammonia-nitrogen
- Total Alkalinity (as mg/L CaCO<sub>3</sub>)
- Chlorides
- Iron
- Mercury
- Nitrate
- Sodium
- Total dissolved solids (TDS)
- Biochemical Oxygen Demand (BOD<sub>5</sub>)
- Chemical Oxygen Demand (COD)
- Parameters listed in 40 CFR (Code of Federal Regulations) Part 258, Appendix II

### ZONE OF DISCHARGE

The zone of discharge (ZOD) for the landfill is defined in the permit as follows: “The zone of discharge for the facility shall be a three dimensional volume, defined in the horizontal plane as extending 100 feet from the edge of the solid waste deposit, or to the property boundary, whichever is less, as depicted in Attachment B of the Monitoring Plan Implementation Schedule (Exhibit I) of this permit, and defined in the vertical plane as extending from the top of the ground to the bottom of the screen of the lower surficial monitoring wells.”

Table 3-3 lists monitoring wells and approximate distances to the edge of the horizontal ZOD. The table also includes each well’s distance from the edge of waste.

**Table 3-3. Locations of Monitoring Wells Relative to the Horizontal Zone of Discharge**

Well No.	Purpose	ZOD Description Width, Feet	Monitoring Well Distance to ZOD (Feet)	Monitoring Well Distance to Edge of Waste (Feet)
MW-1A	Background	100	45	55
MW-1B	Background	100	49	51
MW-2AR	Background	100	37	63
MW-2B	Background	100	49	51
MW-3A	Compliance	PB	12	33
MW-3B	Compliance	PB	10	35
MW-4A	Compliance	PB	12	34
MW-4B	Compliance	PB	9	37
MW-5A	Compliance	PB	11	35
MW-5B	Compliance	PB	9	37
MW-6AR	Background	100	37	67
MW-6BR	Background	100	36	64
MW-7A	Background	PB	6	37
MW-7B	Compliance	PB	7	36
MW-8R	Background	100	40	60
MW-FL1	Compliance	100	10	36
MW-FL2R	Compliance	100	21	79
MW-FL3	Compliance	100	54	46

Notes:

1. Distances are measured to within +/- 10 feet and are based on the survey maps.
2. The 100 ft value in the “ZOD Description” indicates the ZOD is 100 feet from the edge of waste and lies within the property boundary.
3. The PB value in the “ZOD Description” indicates the ZOD is less than 100 feet from the edge of waste and lies at the property boundary.

## GROUNDWATER QUALITY

Water quality data for the groundwater parameters monitored during this reporting period were evaluated in accordance with Chapter 62-701.510(9)(b), FAC. Selected data tables and graphs are presented to support the evaluation of the adequacy of the water quality monitoring frequency and sampling locations.

Appendix B includes tables listing water quality detections and exceedances. In accordance with Chapter 62-701, FAC, groundwater results were compared to primary drinking water standard (PDWS) and secondary drinking water standard (SDWS) listed in Chapter 62-550. For this technical report, groundwater cleanup target levels (GCTLs) in Rule 62-777, FAC, were used for constituents that do not have a PDWS or SDWS as a screening tool for potential anomalies in the

concentration data that may require further consideration or review. Exceedances of one or more parameters over the previous 24 months were evaluated in accordance with the permit.

Graphs of water quality data and water quality trends for selected detected constituents are included in Appendix C. Graphs are provided for constituents that frequently exceeded their respective drinking water standard and/or exhibited significant trends (by visual review of the graphs, not statistical analysis) in their concentrations over time. Laboratory analytical data from the 2004 background monitoring events and from 2008 through June 2013 semi-annual events, were used in the graphs of water quality data. The following section discusses exceedances and includes related trends, where appropriate. The relationship between total dissolved solids and specific conductance is presented following the exceedances discussion.

### **Metals Exceedances and Trends**

Metals with concentrations in excess of applicable PDWS, SDWS, and/or GCTLs for at least one sampling event in the 24-month period of record include:

- Aluminum
- Iron
- Manganese

These exceedances are discussed below and are based on the exceedance tables included in Appendix B. Applicable trends are discussed based on the time series plots in Appendix C.

#### **Aluminum**

The FDEP SDWS of 200 micrograms per liter ( $\mu\text{g/L}$ ) for aluminum was exceeded at surficial and Floridan aquifer wells including the background wells, with the exception of MW-1B, MW-4A, MW-4B, and MW-7A. This indicates that aluminum concentrations are naturally elevated in this area and do not appear to be related to landfill operations.

Trend charts are shown on Figures C-1 through C-3, Appendix C, for aluminum groundwater concentrations. In each aquifer, aluminum results generally have either remained the same or decreased relative to the initial 2004 background sampling. VLF does not appear to be adversely impacting the aluminum concentration in the local groundwater.

#### **Iron**

The concentration of iron in the groundwater ranged from undetected to 1,400  $\mu\text{g/L}$  in the surficial aquifer and undetected to 380  $\mu\text{g/L}$  in the Floridan aquifer. The SDWS of 300  $\mu\text{g/l}$  for iron was exceeded at MW-2AR, MW-2B, MW-3A, MW-5B, MW-6AR-, MW-6BR, MW-7B, MW-8R, MW-FL1, and MW-FL2R. Concentrations ranges for these wells are consistent with site data for iron. Trend charts are shown on Figures C-4 through C-6, Appendix C show iron concentrations decreasing or generally staying constant. Based on the background levels of iron, the iron exceedances are associated with naturally occurring iron and do not appear to be a concern at this time.

## Manganese

The FDEP SDWS of 50 µg/L for manganese was exceeded at background well MW-6BR during the June 2011 monitoring event indicating that manganese concentrations are naturally elevated in the area. Subsequent sampling concentrations have been below the SDWS.

## Organic Parameters Exceedances and Trends

Organic parameters were not detected above their respective PDWS, SDWS, and GCTLs.

## Inorganic Parameters Exceedances and Trends

Inorganic analytes with concentrations in excess of applicable PDWS, SDWS, and/or GCTLs for at least one sampling event in the 24-month period of record include:

- Chlorine Dioxide
- Dissolved Oxygen Percent Saturation
- Nitrate
- pH

These parameters are discussed below.

### Chlorine Dioxide

Chlorine dioxide was collected as part of the City of Apopka permit renewal requirements during the December 2012 monitoring event. During the December 2012 monitoring event, the FDEP PDWS of 0.8 mg/L for chlorine dioxide was exceeded at background wells MW-2B (1.34 mg/L), MW-7A (0.9 mg/L), and MW-8R (2.7 mg/L). The chlorine dioxide exceedances at wells MW-2B, MW-7A, and MW-8R are not due to the landfill. These wells are located hydraulically up gradient to the waste. Chlorine dioxide exceedances are believed to be related to nearby RIBs facilities.

### Dissolved Oxygen Percent Saturation

The Dissolved Oxygen Percent Saturation exceeded the recommended guidelines at every monitoring well location except MW-1B, MW-2B, MW-4A, MW-5B, and MW-FL3 for at least one sampling event during this reporting period. The dissolved oxygen concentrations are thought to be related to natural background conditions (e.g., relatively high rainfall infiltration rates) since low flow sampling techniques are utilized at the site and the elevated oxygen saturations were present prior to waste placement.

### Nitrate

The FDEP PDWS of 10 mg/L for nitrate was exceeded at monitoring wells MW-1A, MW-6AR, and MW-7A. Trend chart is shown on Figure C-7, Appendix C, for nitrate groundwater concentrations. These are background monitoring wells and indicate that exceedances are not due to landfill operations. Nitrate exceedances are believed to be related to RIB Facilities, which

have been previously documented as potential sources for nitrates: Special Publication SJ2006-SP3, *Estimates Of Upper Floridan Aquifer Recharge Augmentation Based On Hydraulic And Water-Quality Data (1986-2002) From The Water Conserv II RIB Systems, Orange County, Florida* (<http://sjr.state.fl.us/programs/outreach/pubs/techpubs/pdfs/SP/SJ2006-SP3.pdf>).

## pH

The majority of the background and detection groundwater monitoring wells had pH concentrations below the FDEP SDWS range of 6.5 to 8.5 units for at least one sampling event. Trend analyses for pH measurements (Figures C-8 through C-10, Appendix C) indicate a wide range of concentrations with increasing and decreasing trends occurring in various wells. Low groundwater pH in this region is the result of low pH in precipitation, rapid recharge, and little buffering capacity of the surficial sands. The pH levels observed at VLF are characteristic of the ground water in this region of Florida.

The SDWS range was exceeded at MW-FL2R. This compliance monitoring well showed elevated pH values for most sampling events with the highest result at 10.84 units in the June 2011 sampling event. The high pH indicates that grout is in the sand pack and may be due to improper well construction or the abandonment of MW-FL2; however, the groundwater analytical data show that the problem only affects the pH, and that the overall geochemistry is similar to the other wells. Therefore, this well is suitable as a compliance well with the understanding that the pH may be elevated and is considered an artifact of well construction.

## Total Dissolved Solids/Specific Conductance Correlation

A simple ratio was calculated to evaluate the correlation between TDS and specific conductance (SCond) data. The ratio between TDS and SCond may be evaluated using standard water/wastewater analysis methods to assess the accuracy of the laboratory methods. A generally acceptable correlation is a TDS to SCond ratio of 0.55 to 0.70. Ratios significantly outside this range may indicate that one or both measurements are suspect.

A summary of the TDS/SCond ratios for the reporting period is presented in Table 3-4. The ratios are generally within the acceptable range or are slightly outside the range. Overall, there are relatively few significant deviations. These deviations are most likely due to differences in field sampling techniques and/or calibration errors and do not affect the quality of the reported data.

**Table 3-5. Total Dissolved Solids/Specific Conductivity Ratios**

Well ID	June 2011	December 2011	June 2012	December 2012	June 2013
MW-1A	0.8	0.64	0.81	0.61	0.69
MW-1B	0.63	0.53	0.58	0.62	0.62
MW-2AR	---	0.56	---	1.23	0.88
MW-2B	0.53	0.51	0.52	0.66	0.53
MW-3A	0.77	0.72	0.74	0.56	0.53
MW-3B	0.83	0.69	0.66	0.92	0.45
MW-4A	0.75	0.85	0.73	0.50	0.33
MW-4B	0.84	0.90	0.12	0.73	0.48
MW-5A	0.73	0.69	0.70	0.89	0.23
MW-5B	0.59	0.55	0.59	0.67	0.50
MW-6AR	0.73	0.64	0.82	0.58	0.67
MW-6BR	0.61	0.63	0.53	0.57	0.51
MW-7A	0.84	0.64	0.87	0.62	0.78
MW-7B	0.62	0.52	0.62	0.65	0.58
MW-8R	0.56	0.60	0.58	0.82	0.56
MW-FL1	0.65	0.66	0.58	0.68	0.56
MW-FL2R	0.54	0.57	0.52	0.57	0.40
MW-FL3	0.57	0.70	0.77	0.64	0.60

Notes:

1. --- = Monitoring well not sampled due to low water level conditions.
2. Green highlight indicates data significantly outside the typical range (i.e., arbitrarily set at less than half the lower value or more than twice the upper value of the range).

## LEACHATE QUALITY

The previous permit included annual leachate monitoring at the site of the leachate storage tank, L-1. The current permit does not require annual leachate monitoring which ceased in September 2012. The leachate data provided for one sampling event which was evaluated in accordance with Chapter 62-701.510(9)(b). Appendix B includes a table listing the leachate quality detections.

Results of the laboratory analysis of the leachate samples did not indicate detections in excess of the concentrations listed in Title 40 Code of Federal Regulations (CFR) Part 261.24.

## ERRATIC AND POORLY CORRELATED DATA

No other erratic or poorly correlated data were observed in the water quality substantive analyses.

## 4 ADEQUACY OF MONITORING PROGRAM

This section assesses the adequacy of the monitoring program in observing the potential effects of the VLF operations on groundwater.

### SURFICIAL AQUIFER MONITORING

The existing monitoring well locations were selected based on groundwater flow direction. Locations were selected to monitor hydraulically up-gradient groundwater and groundwater that potentially could be affected by landfill operations.

Table 3-2 lists monitoring wells and piezometers at the VLF and the aquifers the wells monitor. Monitoring wells listed under the “Type” column as “DE”, “CO”, and “BG” are included during the routine semi-annual monitoring events. This section discusses the adequacy of well location for horizontal and vertical monitoring and the adequacy of the semi-annual sampling frequency.

#### **Monitoring Well Geographic Location**

Geographic location is guided by the direction of lateral groundwater flow in the aquifers beneath the VLF. Figures A-5 and A-10 are thought to be representative of upper surficial aquifer and intermediate surficial aquifer flow, respectively, as represented by the flow arrows. Typically, background wells would be located at the hydraulically up gradient end of the flow arrows with compliance wells located at the down gradient end within or at the edge of the ZOD. The following discusses the locations of monitoring wells in each aquifer.

#### **Upper Surficial Aquifer Well Location**

Currently, there are five upper surficial aquifer background monitoring wells at the VLF (MW-1A, MW-2AR, MW-6AR, MW-7A, and MW-8R). These monitoring wells are located hydraulically up gradient from the landfill and appear to provide sufficient upper surficial aquifer background data for the VLF.

The geographic location of the detection wells appears to be adequate and effective in monitoring groundwater quality variations. The screen locations at each of the upper surficial aquifer locations appear to adequately monitor the upper surficial aquifer for water quality purposes.

#### **Intermediate Surficial Aquifer Well Location**

Currently, there are three lower surficial aquifer background monitoring wells at the PRL (MW-1B, MW-2B, and MW-6BR). These monitoring wells are located up-gradient from the landfill and appear to provide sufficient intermediate surficial aquifer background data for the VLF.

It is SCS’ understanding that the vertical ZOD is defined as extending from the top of the ground to the bottom of the screen of the lower surficial monitoring wells. The screen locations at each

of the locations appear to adequately monitor the middle and lower zones of the surficial aquifer for water quality purposes.

### **Floridan Aquifer Well Location**

Currently, there are no regulatory-designated Floridan aquifer background monitoring wells at the VLF. Based on well logs and similar water levels to surficial aquifer intermediate zone wells MW-FL2R appears to be installed in a deep portion of the surficial aquifer intermediate zone, possibly in a relic karst feature. The screen locations at monitoring wells MW-FL1 and MW-FL3 appear to adequately monitor the upper Floridan aquifer for water quality purposes.

### **Monitoring Frequency**

Groundwater monitoring frequency for the VLF is semi-annual and appears to provide sufficient data to evaluate trends in concentrations and plan appropriate evaluation monitoring where necessary. There have been no findings that indicate a need to modify the routine sampling frequency. The average groundwater velocity was calculated to be approximately 25 feet/year. Consequently, VLF will maintain the current groundwater quality monitoring frequency.

### **Monitoring Parameters**

Current routine monitoring parameters include various volatile organic, metals, and inorganic constituents required by Chapter 62-550 and 62-701 and expected waste characteristics. There have been no findings or observations that indicate a need to modify the routine parameter list. Consequently, the VLF will maintain the current groundwater quality monitoring parameters.

## **LEACHATE MONITORING**

E-mail correspondence dated September 25, 2012, from Kim Rush, FDEP, granted approval to remove annual leachate sampling and analysis from the site requirements per the Chapter 62-701, FAC, rule change. Leachate sampling was terminated accordingly.

Turbidity	NS	NS	NTU	5.5	0.79	0.97	2.19	0.09	1.03	2.26	0.39

Notes:

1. PDWS = Primary Drinking Water Standard (62-550 F.A.C.)
2. SDWS = Secondary Drinking Water Standard (62-550 F.A.C.)
3. GCTL = Groundwater Clean-Up Target Level (62-777 F.A.C.)
4. NS = No numeric standard has been set for this analyte.
5. --- = Parameter not analyzed.
6. mg/L = milligrams per liter
7. ug/L = micrograms per liter
8. SU = Standard Units
9. NTU = nephelometric turbidity units
10. umhos/cm = micromhos per centimeter
11. % Sat = percent saturation
12. Yellow shaded values indicate parameter concentrations exceed primary, secondary drinking water standards, or groundwater cleanup target levels.
13. Degrees C = degrees Celsius
14. U = Analyte concentration was below the laboratory detection limit (value shown).
15. I = Analyte concentration was between the laboratory detection limit and laboratory practical quantitation limit.
16. V = Analyte was detected in the sample and associated method blank.
17. Q = Sample held beyond the accepted holding time.
18. Y = Laboratory analysis was from an improperly preserved sample. The data may not be accurate.
19. Dry = Monitoring well purged dry and a sample was not collected.

Notes:

1. PDWS = Primary Drinking Water Standard (62-550 F.A.C.)
2. SDWS = Secondary Drinking Water Standard (62-550 F.A.C.)
3. GCTL = Groundwater Clean-Up Target Level (62-777 F.A.C.)
4. NS = No numeric standard has been set for this analyte.
5. --- = Parameter not analyzed.
6. mg/L = milligrams per liter
7. ug/L = micrograms per liter
8. SU = Standard Units
9. NTU = nephelometric turbidity units
10. umhos/cm = micromhos per centimeter
11. % Sat = percent saturation
12. Yellow shaded values indicate parameter concentrations exceed primary, secondary drinking water standards, or groundwater cleanup target levels.
13. Degrees C = degrees Celsius
14. U = Analyte concentration was below the laboratory detection limit (value shown).
15. I = Analyte concentration was between the laboratory detection limit and laboratory practical quantitation limit.
16. V = Analyte was detected in the sample and associated method blank.
17. Q = Sample held beyond the accepted holding time.
18. Y = Laboratory analysis was from an improperly preserved sample. The data may not be accurate.
19. Dry = Monitoring well purged dry and a sample was not collected.

Notes:

1. PDWS = Primary Drinking Water Standard (62-550 F.A.C.)
2. SDWS = Secondary Drinking Water Standard (62-550 F.A.C.)
3. GCTL = Groundwater Clean-Up Target Level (62-777 F.A.C.)
4. NS = No numeric standard has been set for this analyte.
5. --- = Parameter not analyzed.
6. mg/L = milligrams per liter
7. ug/L = micrograms per liter
8. SU = Standard Units
9. NTU = nephelometric turbidity units
10. umhos/cm = micromhos per centimeter
11. % Sat = percent saturation
12. Yellow shaded values indicate parameter concentrations exceed primary, secondary drinking water standards, or groundwater cleanup target levels.
13. Degrees C = degrees Celsius
14. U = Analyte concentration was below the laboratory detection limit (value shown).
15. I = Analyte concentration was between the laboratory detection limit and laboratory practical quantitation limit.
16. V = Analyte was detected in the sample and associated method blank.
17. Q = Sample held beyond the accepted holding time.
18. Y = Laboratory analysis was from an improperly preserved sample. The data may not be accurate.
19. Dry = Monitoring well purged dry and a sample was not collected.

2. SDWS = Secondary Drinking Water Standard (62-550 F.A.C.)
3. GCTL = Groundwater Clean-Up Target Level (62-777 F.A.C.)
4. NS = No numeric standard has been set for this analyte.
5. --- = Parameter not analyzed.
6. mg/L = milligrams per liter
7. ug/L = micrograms per liter
8. SU = Standard Units
9. NTU = nephelometric turbidity units
10. umhos/cm = micromhos per centimeter
11. % Sat = percent saturation
12. Yellow shaded values indicate parameter concentrations exceed primary, secondary drinking water standards, or groundwater cleanup target levels.
13. Degrees C = degrees Celsius
14. U = Analyte concentration was below the laboratory detection limit (value shown).
15. I = Analyte concentration was between the laboratory detection limit and laboratory practical quantitation limit.
16. V = Analyte was detected in the sample and associated method blank.
17. Q = Sample held beyond the accepted holding time.
18. Y = Laboratory analysis was from an improperly preserved sample. The data may not be accurate.
19. Dry = Monitoring well purged dry and a sample was not collected.

**Summary of Detected Parameters, MW-FL2R**
