1.0 INTRODUCTION

1.1 SITE INFORMATION

The Citrus County Central Class I Landfill (landfill) is located in central Citrus County approximately three miles east of Lecanto, Florida, near State Road 44. The landfill is located at latitude 28° 51' 08" North and longitude 82° 26' 38" West in Section 1, Township 19 South, Range 18 East. The landfill is composed of a closed 60-acre landfill and an active 20-acre landfill. The active landfill is a lined cell with a leachate collection system. With the exception of seven acres, the closed landfill is unlined and is not served by a leachate collection system. The entire closed landfill is capped with a membrane and soil cover.

The purpose of a groundwater monitoring plan (GWMP) is to detect any existing or potential releases, which can be generated from the landfill. The intent of this permit renewal application is to utilize the existing GWMP with a few minor modifications. This GWMP review will address on-site groundwater and leachate monitoring. Also included in the GWMP are previously reported geologic cross sections (Appendix A), a private water well inventory (Appendix B), a summary of groundwater parameters (Appendix C), and groundwater contour maps (Appendix D).

Compliance monitoring at the landfill currently includes groundwater and leachate in accordance with the Florida Department of Environmental Protection (FDEP) Permit SO09-274381 issued October 28, 1996. Groundwater and leachate are currently monitored on a semiannual basis. A map of site features, including all groundwater monitoring well locations is included as Figure 1.

The previously permitted groundwater monitoring network at the landfill incorporates the semiannual sampling of 14 monitoring wells. All of the wells are installed into and monitor the Floridan aquifer. Monitoring wells MW-1R, MW-2, MW-3, and MW-7 are listed as "background" wells. However, it should be noted that MW-1R is located downgradient of the active landfill and upgradient of the closed landfill. The remaining background wells are all located upgradient of both landfills. Monitoring wells MW-4, MW-5, and MW-6 are listed as "intermediate" wells. These wells were installed to monitor on-site percolation ponds located in between the closed and active landfills. Monitoring wells MW-B, MW-AA, MW-C, MW-D, MW-8, and MW-9 are listed as "detection" wells. Monitoring well MW-E is listed as a "compliance" well. Monitoring well construction details are provided in Table 1.

The landfill lies within the Hernando Hammock physiographic subdivision of the Ocala Uplift District as described by Brooks (1981). This region is characterized by remnant erosional hills and ridges, which are in-filled with thick, weathered deposits of sand and clayey sand. The landfill is also within the northern portion of what called the Brooksville Ridge. The Brooksville Ridge is characterized as an extensive, internally drained, karst terrain with high local relief.

* Assumed based on video logging descriptions of "open hole".

Regional geology in the landfill area is typically characterized by undifferentiated sands and clays at the surface, underlain by clays and other materials associated with the Hawthorn Formation. The thickness and continuity of the Hawthorn sediments varies greatly in the area. The Hawthorn may act as a partial confining unit for the Floridan aquifer in some parts of the region. Beneath the Hawthorn lies a thick sequence of Eocene age carbonate deposits, which generally consist of limestones of the Suwannee, Ocala, and Avon Park formations.

Site specific geology is characterized by approximately 130 feet of surficial sands ranging from fine to medium sands to clayey, silty fine sands. Several 1-foot to 2-foot clay layers are present between 50 and 80 feet bls. These sediments form a low permeability unit over the Floridan aquifer with an average hydraulic conductivity of 0.024 foot per day. Beneath these sediments lies the Suwannee Formation. The Suwannee has a highly irregular surface beneath the site, with elevations ranging from 80 feet NGVD to -54 feet NGVD.

1.2 PRIVATE WELL INVENTORY

A private well inventory of all wells within a one-mile radius of the landfill was conducted in 1995 by Hydro Q, Inc., as part of the Groundwater Monitoring Plan for the 80-acre expansion landfill. A copy of the 2001 inventory is included in Appendix B. In March 2001, JEA requested an updated private well inventory from the Southwest Florida Water Management District (SWFWMD). A copy of the updated inventory is also provided in Appendix B.

2.0 SUMMARY OF SITE DATA

2.1 GROUNDWATER

2.1.1 Groundwater Quality

Groundwater is sampled and analyzed semiannually for the parameters listed in Table 2. Detailed on-site data have been submitted on a semiannual and biennial basis to the FDEP and thus will not be included in this review. Several volatile organic compounds, metals, indicator parameters, and field parameters are discussed below. Summary tables of parameter values discussed are presented in Appendix C.

Table 2 Semiannual Groundwater Parameter List	
Field Parameters	Laboratory Parameters
Static Water Level before purging	Total Ammonia – N
Specific Conductivity	Chlorides
pH	Iron
Dissolved Oxygen	Mercury
Turbidity	Nitrate
Temperature	Sodium
Colors and Sheens (by observation)	Total Dissolved Solids (TDS)
	Those parameters listed in 40 CFR Part 258, Appendix I

Historically, Benzene and Vinyl Chloride were detected slightly above FDEP groundwater criteria in several downgradient wells. This issue was addressed in a Contamination Assessment Report prepared by CH2M Hill in 1996. The FDEP concurred with the recommendation made within the report to continue to monitor the low levels of Benzene and Vinyl Chloride. As discussed below, levels of both parameters have been decreasing or have remained consistent since 1996.

Benzene was reported above the Primary Drinking Water Standard (PDWS) of 1 µg/L at least one time during the current permit period in monitoring wells MW-5, MW-6, MW-7, MW-8, MW-9, and MW-AA. Well MW-5 reported Benzene at 2 µg/L in 96S2. Groundwater samples were not collected from MW-5 (and MW-4) after the 96S2 event. Groundwater samples from MW-6 reported Benzene at levels ranging from below the laboratory detection limit to 3.1 µg/L. The MW-6 values appear to be steady over time. MW-7 reported Benzene at 3.0 µg/L in 99S2. All previous and subsequent events have reported Benzene below the laboratory detection limit for MW-7. Benzene was reported at values ranging from 3.5 to 8.4 µg/L in MW-8, with no apparent trend. During 97S2, Benzene was reported at 1.2 µg/L in monitoring well MW-9, but below the laboratory detection limit in all subsequent events. The 97S2 value for MW-9 appears to be anomalous. Benzene was reported in MW-AA at 1.4 and 1.2 µg/L during 97S2 and 00S1, respectively. These values also appear to be anomalous. Benzene was reported below the

laboratory detection limit in all remaining wells during the entire permit period. In summary, low levels of Benzene have been reported at steady concentrations in MW-6 and MW-8. All other wells have reported Benzene below the laboratory detection limit or sporadically at low levels, which appear to be anomalous.

Vinyl Chloride was reported at or above the PDWS of 1 µg/L at least one time during the current permit period in monitoring wells MW-5, MW-6, MW-8, MW-9, MW-AA, and MW-E. Monitoring well MW-5 reported Vinyl Chloride at 1 µg/L during 96S2, the last event which this well was sampled. Vinyl Chloride levels in MW-6 ranged from 4.6 µg/L to below the laboratory detection limit. Levels in MW-6 were decreasing over time. Levels in MW-8 were generally steady over time, ranging from 1.1 to 10 µg/L. Vinyl Chloride levels in MW-9 ranged from 3.5 µg/L to below the laboratory detection limit, on a decreasing trend. In fact, Vinyl Chloride was reported below the laboratory detection limit for the last four sampling events in MW-9. Levels in MW-AA ranged from below the laboratory detection limit to 7.8 µg/L, with no observable trend. Levels in MW-E ranged from below the laboratory detection limit to 3.3 µg/L, with a decreasing trend. Similar to MW-9, levels in MW-E were below the laboratory detection limit during the last four sampling events. Vinyl Chloride was reported below the laboratory detection limit during the entire permit period in all remaining wells. In general, where Vinyl Chloride has been reported above the detection limit, levels appear to be decreasing or remaining steady over time.

In 1994 and 1995, Sodium and Total Dissolved Solids (TDS) were reported above groundwater criteria for monitoring wells MW-5 and MW-6. This issue was addressed in a document entitled "Computer Simulations of Solute Concentrations in Groundwater at the Citrus County Central Landfill (CH2M Hill, 1996). FDEP agreed with the conclusion of this document that Sodium and TDS levels associated with leachate disposal activities were not projected to exceed drinking water standards at the landfill boundary. As discussed below, Sodium and TDS values have been decreasing in MW-6 and the remaining wells since 1996.

Sodium was reported above the PDWS of 160 mg/L in MW-6 during 96S2, at a value of 300 mg/L. No other exceedances were reported for MW-6 or any of the other wells during the current permit period. Background levels generally ranged from 10 to 150 mg/l, with MW-7 reporting the highest background concentrations. Sodium levels in MW-6 decreased from 300 mg/L in 96S2 to 80 mg/L in 97S1 and have remained relatively steady. Levels in the downgradient wells ranged from 3 to 28 mg/L with steady trends. Overall, elevated Sodium levels reported for MW-6 appear to have subsided since 1996. Downgradient Sodium values are very consistent with background levels.

Levels of TDS at or above the Secondary Drinking Water Standard (SDWS) of 500 mg/L were reported in MW-6 in 96S2 (800 mg/L) and 97S2 (600 mg/L). Additionally, monitoring wells MW-7, MW-8, MW-9, MW-AA, and MW-E reported TDS above the SDWS during 97S2. All other values reported during the current permit period were below the SDWS. Background levels ranged from 500 mg/L to below the laboratory detection limit. Downgradient detection

well values generally ranged from 30 to 450 mg/L. All values appear to be steady over time. Sodium has not been reported at or above the SDWS since 1997 in any on-site wells.

All reported Chloride values were at or below the SDWS of 250 mg/L during the current permit period. The highest values were reported in MW-6, ranging from 200 to 110 mg/L on a steady trend. Background levels were typically less than 10 mg/L. Downgradient detection well values consistent with background levels. Fluctuations in Chloride values were generally consistent with Conductivity values within wells.

Iron was reported at levels above the SDWS of 300 µg/L in all monitoring wells at least one time during the current permit period. Iron concentrations in background wells MW-2, MW-3, and MW-7 ranged from 660 µg/L to below the laboratory detection limit. Iron levels in background well MW-1R ranged from 2,900 to 10,000 µg/L. The highest downgradient iron concentrations were reported for MW-AA, with values ranging from 6,160 to 14,000 µg/L. MW-9 iron values were similar to those reported for MW-AA, with values ranging from 550 to 13,000 µg/L. Iron concentrations reported for MW-8 and MW-D were similar, with values ranging from 270 to 2,500 µg/L and 180 to 1,400 µg/L, respectively. Iron concentrations in MW-C ranged from 780 µg/L to below the laboratory detection limit. Values in MW-B ranged from 1,580 µg/L (reported in 00S2, with the previous high value being 254 µg/L) to below the laboratory detection limit. Values in downgradient wells MW-B and MW-C were generally similar to background levels. Iron concentrations in the remaining downgradient wells were slightly elevated relative to the reported background concentrations, with the exception of MW-1R.

Levels of pH below the lower SDWS of 6.5 were reported in nearly all monitoring wells. Background levels and downgradient values were very similar, again indicating that the low values are representative of naturally occurring conditions. Levels of pH were consistent over time.

Nitrate was reported above the PDWS of 10 mg/L in monitoring well MW-6 during all events. Values in all other wells were below the PDWS. Levels in MW-6 ranged from 73 to 19 mg/L, with a decreasing trend. Background levels ranged from 0.26 mg/L to below the laboratory detection limit. Downgradient values generally ranged from below the laboratory detection limit to 2.6 mg/L. Nitrate levels were generally steady or decreasing over time.

2.1.2 Groundwater Flow

Groundwater contour maps generated from groundwater elevation data collected during the current permit period are presented in Appendix D. Groundwater elevations reported for monitoring wells MW-8R and MW-9 were erroneous due to an error in the measurement of the top of casing elevation. These wells were resurveyed in February 2001. Using the corrected top of casing elevations, new groundwater elevations were calculated for MW-8R and MW-9. A groundwater contour map incorporating the corrected values is presented as the first figure in Appendix D. As shown in the contour maps, groundwater flow at the site is generally to the west. A mounding effect is apparent in the vicinity of the on-site percolation ponds located

between the closed and active landfills. Radial groundwater flow from the mounded area is observed during several monitoring events. The western flow direction depicted in the corrected contour map is consistent with historical interpretations at the landfill, as well as regional interpretations by the SWFWMD (Potentiometric Surface of the Upper Floridan Aquifer, September 2000). Groundwater elevations at the site generally ranged from 3 to 9 feet National Geodetic Vertical Datum (NGVD). The highest values were reported during January 1999, while the lowest values were reported during August 2000. The corresponding depths to water for these calculated groundwater elevations generally ranged from 105 to 120 feet below land surface.

Based on groundwater elevation data collected during the current permit period, a conservative estimate of the average hydraulic gradient across the site is 0.0028 feet/foot. The average hydraulic conductivity at the site has been reported as 15.7 feet/day (CH2M Hill 1996). Given the hydraulic gradient, hydraulic conductivity, and an estimated effective porosity of 0.2, the groundwater velocity at the site can be calculated with the following equation:

$$V = Ki / n$$

where: V = average horizontal groundwater velocity (ft/day)
K = horizontal hydraulic conductivity (ft/day)
i = hydraulic gradient (ft/ft)
n = effective porosity (percent)

Using the data discussed above, $V = (15.7 \text{ ft/day})(0.0028 \text{ ft/ft}) / 0.2$. Therefore, a conservative estimate of the average horizontal groundwater velocity at the site is 0.22 ft/day or 80 ft/year.

2.2 LEACHATE

Leachate influent is sampled from the master lift station (as shown in Figure 2) semiannually and analyzed for the parameters listed in Tables 3 and 4 on an alternating basis. Leachate influent is collected and treated onsite. Leachate effluent from the treatment facility is then placed into rapid infiltration ponds (RIPs) located at the eastern edge of the 60-acre unlined landfill. Prior to placement into the RIPs, leachate effluent is sampled at the location shown in Figure 3.

Table 3 Semiannual Leachate Parameter List

Color and Sheens (by observation)	Mercury
	Nitrate
	Sodium
	Total Dissolved Solids (TDS)
	Those parameters listed in 40 CFR Part 258, Appendices I and II

Leachate effluent is sampled daily, weekly, and quarterly and analyzed for the parameters in Specific Condition 33a of the existing permit. Of the parameters listed in Specific Condition 33a, the following are used in process control: chlorine residual, COD, total phosphorous, ammonia nitrogen, and total nitrogen. The remaining parameters have been utilized for regulatory compliance under the existing permit. During the current permit period, Chlorides ranged from 350 to 1,500 mg/L. The SDWS for Chlorides is 250 mg/L. Sodium and Total Dissolved Solids ranged from 190 to 880 mg/L and from 320 to 4,200 mg/L, respectively. The PDWS for Sodium is 160 mg/L. The SDWS for Total Dissolved Solids is 500 mg/L. Levels of metals were generally low, with most values below the laboratory detection limit. Arsenic was reported most consistently, with values ranging from below the laboratory detection limit to 29 mg/L. Volatile organic compound levels were typically below the laboratory detection limits. Very low levels of Total Xylenes, Ethylbenzene, and Ethylene Dibromide were reported sporadically. Total trihalomethanes (THM) ranged from below the laboratory detection limit to 730 µg/L. The PDWS for THM is 100 µg/L. THM was reported at values less than 72.7 µg/L during eight monitoring events. The remaining nine sampling events reported THM at values ranging from 115 to 730 µg/L (the 00Q4 value was 730 µg/L, all other values were less than 366 µg/L). During 00Q3 samples were taken before and after the chlorinating. The pre-chlorinating THM value was below the laboratory detection limit. The post-chlorinating THM value was 60.2 µg/L. The THM values reported during the current permit period are most likely the result of the chlorination process utilized in the leachate treatment, as evidenced by the pre- and post-chlorination values reported in 00Q3.

3.0 EVALUATION OF MONITORING PRACTICES

3.1 GROUNDWATER

The previously permitted groundwater monitoring network (GMN) consists of the following:

<u>Site Background Wells</u>	<u>Detection Wells</u>	<u>Intermediate Wells</u>	<u>Compliance Wells</u>
MW-1R	MW-8*	MW-4**	MW-E
MW-2	MW-9	MW-5**	
MW-3	MW-AA	MW-6	
MW-7	MW-B		
	MW-C	*Replaced by MW-8R	
	MW-D	**Later classified as "Water-Level-Only"	

The monitoring well locations are shown in Figure 1. As shown in Figure 1, monitoring wells MW-8, MW-9, MW-AA, MW-C, MW-D, and MW-E are located along the western landfill boundary, downgradient of both landfills. Monitoring wells are spaced approximately equidistant from one another along the entire western perimeter, with a maximum horizontal distance between wells of 470 feet. Monitoring well MW-1R is located along the northern landfill boundary, while MW-B is situated along the southern boundary. Background wells MW-2, MW-3, and MW-7 are located along the eastern landfill boundary, upgradient of the 80-acre expansion area. Based upon the placement of wells along all boundaries potentially downgradient of the landfill, the horizontal spacing of the wells described above, and the direction and rate of groundwater flow, the wells comprising the existing groundwater monitoring network appear to be appropriately positioned to detect any potential impacts to groundwater quality emanating from the landfill. The vertical screen intervals of the wells are listed in Table 1. The highly undulating surface of the limestone at the site and the lack of a consistent overlying confining unit required the installation of wells based on the depth of the water surface and not necessarily the geologic units encountered. As shown in Table 1, monitoring wells MW-2, 3, 4, 5, AA, and B are screened within a silty to fine sand unit. This unit appears to directly overlay limestone. The sand unit encountered at MW-AA contained numerous small limestone fragments within the screened interval. Monitoring wells MW-1R, C, D, and E appear to be screened within limestone. The sand and limestone units are hydraulically well connected due to the lack of a confining layer at the site. The aquifer monitored is under water table conditions. The screen interval depths appear to be appropriate to provide representative groundwater samples based on the depths of the water surface encountered during the current permit.

Two modifications to the existing scheme are proposed at this time. The first proposed modification is that monitoring wells MW-4 and MW-5, formerly classified as "intermediate" wells, should be listed as piezometers. The resulting monitoring network is as follows:

<u>Site Background Wells</u>	<u>Detection Wells</u>	<u>Intermediate Wells</u>	<u>Compliance Wells</u>
MW-1R	MW-8	MW-6	MW-E
MW-2	MW-9		
MW-3	MW-AA	<u>Piezometers</u>	
MW-7	MW-B	MW-4	
	MW-C	MW-5	
	MW-D		

The second proposed modification is that groundwater samples collected from monitoring well MW-6 be analyzed for THM and fecal coliform on a semiannual basis in addition to the current parameters listed in Table 2.

Groundwater monitoring will be continued on a semiannual basis with reports submitted to FDEP.

3.2 LEACHATE

Per pending revisions to Rule 62-701.510(6)(c), F.A.C., the existing leachate influent monitoring frequency is proposed to be reduced from semi-annual to annual. Leachate influent will be analyzed for the parameters listed in Rule 62-701.510(8)(c) with reports submitted to FDEP.

Several modifications to the existing Leachate effluent monitoring scheme are proposed at this time. The first proposed modification is that the analysis of THM within the leachate effluent be changed from the quarterly to annual. In addition to annual THM monitoring of the leachate effluent, monitoring of THM will be added to the semiannual groundwater analyses performed on samples collected from MW-6, as discussed in Section 3.1. Based on the horizontal distance between the infiltration ponds and the edge of the zone of discharge (approximately 1,200 feet) and the vertical distance between land surface and the water table surface (approximately 100 feet of sands), monitoring of THM within MW-6 should be adequate to detect any potential impacts to groundwater quality.

The second proposed modification is that the weekly fecal coliform sampling be removed from the leachate effluent requirements. As discussed in Section 3.1, monitoring of fecal coliforms will be added to the semiannual analyses performed on samples collected from MW-6. Monitoring of fecal coliforms within MW-6 should be adequate to detect any potential impacts to groundwater quality.

The third proposed modification is that the quarterly requirement to analyze for metals (arsenic, barium, cadmium, chromium, iron, mercury, lead, selenium, and silver) be reduced to annual. These metals are monitored on a semiannual basis within groundwater samples collected from all on-site monitoring wells, which provides adequate data to evaluate potential impacts to groundwater quality.

The fourth proposed modification is that the daily requirement to sample for chlorine residual be removed from the leachate effluent monitoring requirements. This parameter is applicable to sources that may be expected to contain fecal matter associated with human activity. The leachate effluent is not excepted to contain such material; therefore, sampling for chlorine residual is not warranted.

The final proposed modification is that the annual requirement to analyze Leachate effluent for the parameters listed in 40 CFR Part 258 Appendix II be changed to Appendix I. No other modifications to the existing Leachate effluent monitoring scheme are proposed at this time.

APPENDIX D

GROUNDWATER CONTOUR MAPS

Corrected Groundwater Contour Map
Citrus County Central Landfill
August 2000

Jones
Edmunds &
Associates, Inc. **JEA**

EXPLANATION:

1. EXISTING WELLS ●
WITH IDENTIFICATION
2. (MW-) INDICATES ABANDONED
WELLS
3. NUMERIC VALUE = WATER
LEVEL ELEVATION
4. ~ CONTOUR LINE
AND ELEVATION

CITRUS COUNTY CENTRAL LANDFILL
MONITORING WELLS

August 2000 Event
Including All Wells

EXPLANATION:

- 1. EXISTING WELLS WITH IDENTIFICATION
- 2. (MW-) INDICATES ABANDONED WELLS
- 3. NUMERIC VALUE = WATER LEVEL ELEVATION
- 4. CONTOUR LINE AND ELEVATION

0 400'
SCALE FEET

(APPROXIMATE)

CITRUS COUNTY CENTRAL LANDFILL
MONITORING WELLS

August 2000 Event
Excluding 8-R & 9

CITRUS COUNTY CENTRAL LANDFILL
MONITORING WELLS

Figure 2. Water Level
Contour Map 7/99

EXPLANATION

- 1. EXISTING WELLS WITH IDENTIFICATION
- (MW-) 2. ABANDONED WELLS

CITRUS COUNTY CENTRAL LANDFILL
MONITORING WELLS
