## **PROJECT DESCRIPTION**

### **Trail Ridge Fuel Site**

This submittal is an application for an Environmental Resource Permit for the proposed Trail Ridge Landfill fuel station facility. The project site is located at 5110 U.S. Hwy 301 in Baldwin, FL. Construction will include a wet detention pond system, and a 0.23 acre paved fueling area.

Runoff from the proposed fuel station site will be treated with a wet detention pond. The pond is designed to detain the first 2.5 inches of runoff from the impervious area as well as provide attenuation of the increased runoff due to development. The pond is equipped with a 2.75" diameter bleed down orifice set at the normal pool elevation. A 9" wide rectangular weir is situated above the required treatment volume to provide attenuation of the runoff to below the predeveloped condition. The weir will be fitted with a skimmer to prevent oil and floating debris from discharging to the adjacent wetland. The water level in the pond was estimated from the NRCS Soil Survey for Duval County. Based on the soils map, the soil type at the site is Pottsburg fine sand, and the seasonal high water elevation is typically 1'-2' below natural grade. Based on this, a normal water elevation of 100 was used throughout the hydrologic models.

A pre/post discharge analysis has been performed for the 25 year/ 24 hour, and the Mean Annual storm events using the SCS Method in ICPR. Runoff curve numbers for pre- and post-developed conditions were estimated using recommended values from the NRCS Tr-55. Times of concentration were determined using the Velocities for Upland method outlined in the NRCS National Engineering Handbook. Based on the calculations presented, the post-development discharge rates do not exceed the pre-development discharge for any of the modeled design storms.

No wetland impacts are proposed for this development.

#### **MSSW Operation and Maintenance**

The stormwater collection and treatment system will be operated and maintained by the City of Jacksonville. Following is a suggested maintenance schedule for the stormwater management system:

<b><u>Frequency</u></b>	<b><u>Task</u></b>
Weekly	Mow around basins
Weekly	Remove trash from storm structures
Monthly	Inspect outlet control structures and catch basins
Bi-annually	Remove nuisance plants within detention pond

## **BASIS OF DESIGN CALCULATIONS**

### **Trail Ridge Fuel Site**

Pond routing was modeled using the SCS Method in ICPR. Total rainfall values used in the calculations were derived from the FDOT rainfall curves for Zone 4

#### **Required Treatment Volume**

Wet detention systems must provide treatment of runoff from the greater of 1" over the project area or 2.5" over the impervious area. The treatment volumes required for each basin are:

#### **Basin 1**

Basin Area (ac)	0.48
Impervious Area	0.23

One inch of runoff = 0.04 ac-ft

2.5 inches times = 0.05 ac-ft  
impervious area

**Treatment Volume Required = 0.05 ac-ft**

#### **Pond 1**

	Stage	Area (ac)	Storage (ac-ft)
Top of Bank	102.00	0.21	0.34
N.W.L.	100.00	0.13	0.00

Weir Elevation = 100.50  
Treatment Provided = 0.08 ac-ft

## Curve Numbers

The SCS curve numbers used in the calculations were estimated based on the type of use and amount of impervious area in the basin. A predevelopment curve number of 61 (Open space, good condition) was used for the basin. The postdeveloped curve number used for the basin was:

### Basin 1

Use	Area (ac)	CN	CN x A
Impervious	0.23	98	22.54
Pond	0.18	100	18.00
Grass	0.07	61	4.27
<b>Total =</b>	<b>0.48</b>		<b>44.81</b>

$$CN = \frac{44.81}{0.48} = 93$$

## Times of Concentration

Times of concentration for the basin were estimated using the Velocities for Upland Method. The longest flow path for the basin was separated into segments based on length of flow and on type of ground cover. The travel times for each segment were then summed to establish the time of concentration:

### Predeveloped

Segment #	1
Length (ft)	310
Cover Type	grass
Slope (%)	0.9
Velocity (fps)	0.3
Travel Time (min)	20.67

$$\text{Time of Concentration (min)} = 20.7$$

**Basin 1**

Segment #	1	2
Length (ft)	150	15
Cover Type	pave	pipe
Slope (%)	1.0	0.5
Velocity (fps)	2.0	1.4
Travel Time (min)	1.25	0.18

**Time of Concentration (min)=**                   **1.4**  
**Use 5 min. minimum**

## PRE/POST DISCHARGE ANALYSIS Trail Ridge Fuel Site

Following is the Pre/Post Analysis for the Trail Ridge Fuel Site. Results for the 25 yr/24 hr and Mean Annual storm events are shown.

### **Predeveloped Basin**

#### **25 Year Storm**

$$Q_{25\text{pre}} = \underline{1.76} \text{ cfs}$$

#### **Mean Annual**

$$Q_{\text{mean-pre}} = \underline{0.46} \text{ cfs}$$

### **Postdeveloped Basin**

#### **25 Year Storm**

$$Q_{25} = \underline{1.39} \text{ cfs}$$

#### **Mean Annual**

$$Q_{\text{mean}} = \underline{0.31} \text{ cfs}$$

The postdevelopment discharges do not exceed predevelopment discharges. Therefore, required attenuation of the stormwater runoff has been met.

## **POND PERMANENT POOL VOLUME**

To meet the design requirements for a wet detention pond, the pond must be designed to maintain a permanent pool for 21 days during the wet season. The permanent pool volume required is:

$$\begin{aligned} \text{Permanent pool volume required} &= \frac{(\text{Area ac})(\text{Runoff Coeff.})(30 \text{ in})(21 \text{ days})}{(153 \text{ days})(12 \text{ in/ft})} \\ &= \underline{\underline{0.14 \text{ ac-ft}}} \end{aligned}$$

	Stage	Area (ac)	Storage (ac-ft)
N.W.L.	100.00	0.13	0.28
Bot of Pond	96.00	0.01	0.00

$$\text{The pond volume below N.W.L.} = \underline{0.28 \text{ ac-ft}}$$

Therefore adequate storage is provided

## POND BLEED-DOWN ANALYSIS

### Trail Ridge Fuel Site

Outflow from the pond will be routed through a circular orifice and a rectangular weir. The orifice will serve as the bleed down device for the pond and will discharge at the normal water level. The rectangular weir will discharge above the required treatment volume and will attenuate runoff from the system to below the predeveloped discharge rate. Discharge from the orifice was estimated using the orifice flow equation:

$$q = aC\sqrt{2gh}$$

where:  $a$  = Flow area of orifice ( $\text{ft}^2$ )

$C$  = Orifice coefficient

$g$  = Gravity constant ( $\text{ft/s}^2$ )

$h$  = Head above orifice center (ft)

The pond was modeled to determine the estimated times for  $\frac{1}{2}$  and for the full treatment volume to recover. The results of the model are on the following page.
