**Re: Southeast County Landfill
 Permit Nos. 35435-006-SO, 35435-007-SO
 Analytical Data Report - August 2006**

Dear Mr. Morris:

In accordance with the above-referenced permits, the Hillsborough County Solid Waste Management Department (SWMD) is pleased to provide the August 2006 analytical data report (ADR) for the water quality monitoring at the Southeast County Landfill (SCLF). Samples were collected on August 14 through August 17, 2006 by the SWMD Field Sampling Team. Any violations of the water quality criteria and the overall impact to the future groundwater monitoring activities at the SCLF are discussed in parameter specific details herein.

FIELD PARAMETERS

pH

The surficial aquifer detection and background water quality monitoring wells continue to exhibit pH values below the SDWS acceptable range of 6.5 to 8.5 pH units. The pH values across the site range in value from 4.47 to 6.39 pH units. The pH at the site has historically been observed to be below the acceptable range. The 1983 Ardaman and Associates, Inc. report titled Hydrogeologic Investigation, Southeast County Landfill, reported pH values ranging from 4.4 to 6.7 pH units in six wells on site. This data was collected prior to construction of the landfill, and supports the position that the pH values observed are attributable to the phosphate mining activities conducted at the site prior to construction of the landfill.

No unusual conditions or changes in pH values within any of the groundwater monitoring wells or surface water sites were observed during this sampling event.

Dept. of Environmental Protection

Mr. John Morris, P.G.

OCT 11 2006

Turbidity

In accordance with the April 3, 2003 Approval of Corrective Action Plan letter from the Florida Department of Environmental Protection (FDEP), the SWMD has recorded turbidity data at the three sampling points along Long Flat Creek. A summary table of data obtained from the surface water sampling points 3A, 3B2B and 3C2 is provided within this ADR. Over the period of record from March to August 2006, the turbidity measurements have been observed within the compliance level of 29 nephelometric turbidity units (NTU) above the background (upstream) value.

Southwest District

No unusual conditions or changes in the turbidity values across the site were observed during this sampling event.

GENERAL PARAMETERS

Total Dissolved Solids

The surficial aquifer detection wells, TH-59 and TH-60, exhibited total dissolved solids (TDS) above the Secondary Drinking Water Standard (SDWS) of 500 milligrams per liter (mg/l) with concentrations of 560 mg/l and 750 mg/l. These wells have consistently exhibited TDS above standards, and were constructed in an area that had been reworked during construction and filled with offsite fill materials prior to construction of these detection wells addressing Section 7. All of the other monitoring wells were observed below the SDWS for TDS during this sampling event.

Radium 226

The Weeks' private supply well exhibited concentrations of radium 226 at 11.3 picocuries per liter (pCi/l), which is above the Primary Drinking Water Standard (PDWS) of 5 pCi/l. This supply well has periodically been observed to exhibit radium 226 above the PDWS. No unusual conditions or changes in radium 226 values were observed during this sampling event, and the home owner shall be appropriately notified of this condition. The detection of this radiological parameter in the Weeks' private supply well is not readily attributable to the landfill operations, and is likely attributable to the past strip mining activities in the area.

Fecal Coliform

The surface water sampling point 3B2B, which is the middle data point on Long Flat Creek, exhibited concentrations of fecal coliform at 1,100 colonies per 100 milliliter (col/100ml). This value is above the Surface Water Standard of 800 col/100ml. No other surface water sites exceeded the standard during this event, and the SWMD believes that the coliform is likely attributable to bird activity in the vicinity.

Mr. John Morris, P.G.
October 4, 2006
Page 3

METALS

Iron

Iron concentrations in fourteen of the eighteen surficial aquifer monitoring wells were observed above the SDWS of 0.300 mg/l. The highest concentration for iron was 9.5 mg/l in detection well TH-65. The iron concentrations observed in the surficial aquifer wells across the site have historically been elevated, and the 1983 Ardaman and Associates, Inc. report titled Hydrogeologic Investigation, Southeast County Landfill, reported iron above the PDWS at concentrations ranging from 0.43 to 20.0 milligrams per liter (mg/l). Based on the iron concentrations observed prior to construction of the landfill, the iron historically observed across the site is likely attributable to the past mining activities. Additionally, as presented to the FDEP by our contracted consultant, Jones Edmunds, the landfill liner systems have created anaerobic environments under the lined cells of Sections 7 and 8. These environments are known to facilitate iron reducing bacteria processes which result in the higher iron concentrations in the areas down gradient of these liner systems. It should also be noted that areas at the SCLF that have been disturbed by mining or landfill construction activities appear to exhibit the highest iron concentrations. Based on these potential sources of iron in the groundwater at the site, the SWMD maintains the position that the source of iron is not the buried wastes within the landfill.

The private supply wells owned by Weeks and Holland exhibited levels of iron above the SDWS with concentrations of 0.59 mg/l and 1.9 mg/l, respectively. These wells consistently exhibit iron above the SDWS. No unusual conditions or changes in iron concentrations within any of the groundwater monitoring wells or surface water samples at the site were observed during this event.

Iron exceeded the surface water criteria of 1 mg/l as per Chapter 62-302, F.A.C. at the surface water monitoring point 3B2B. A value of 1.5 mg/l was observed at this location during this sampling event.

Nickel

Nickel was observed in TH-59, TH-59C, and TH-60 below the PDWS of 0.1 mg/l during this sampling event. Nickel has consistently been observed in these wells since the initial samples were collected in October 2003 prior to waste being placed in the Section 7 cell.

ORGANIC PARAMETERS

The organic parameters were analyzed by EPA Method 8260. The results of analyses are discussed in detail in the following paragraphs. Benzene was observed in the Section 7 detection monitoring well TH-60 below the PDWS of 1 microgram per liter (ug/l) at a concentration of 0.85 ug/l. Toluene was observed well below the SDWS of 1,000 ug/l in Section 7 detection wells TH-59C and TH-60C with results of 1.3 ug/l and 5.3 ug/l, respectively.

Mr. John Morris, P.G.
October 4, 2006
Page 4

The SWMD maintains the position that the impacts to the Section 7 detection wells are the direct result of landfill gas migration from Section 7. Residual effects from the previous presence of landfill gas remain in the area, and trace concentrations are observed in the monitoring wells in this area.

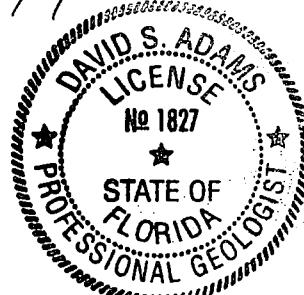

Enclosed for your review is a detailed site location map, the analytical data summary tables, a groundwater elevation data summary table, a surficial aquifer groundwater elevation contour diagram, a data summary table of turbidity measurements, a data summary table for the private supply wells, copies of the letters sent to the owners of the private wells, and the complete laboratory analytical data report sheets. The next sampling event is scheduled for November 2006, and this quarterly event will address the Phases I – VI modified permit conditions.

Should you have any questions, require any additional information, or would like to discuss the information provided within this submittal, please feel free to contact me at (813) 276-2944 or via e-mail at adamsds@hillsboroughcounty.org.

Sincerely,

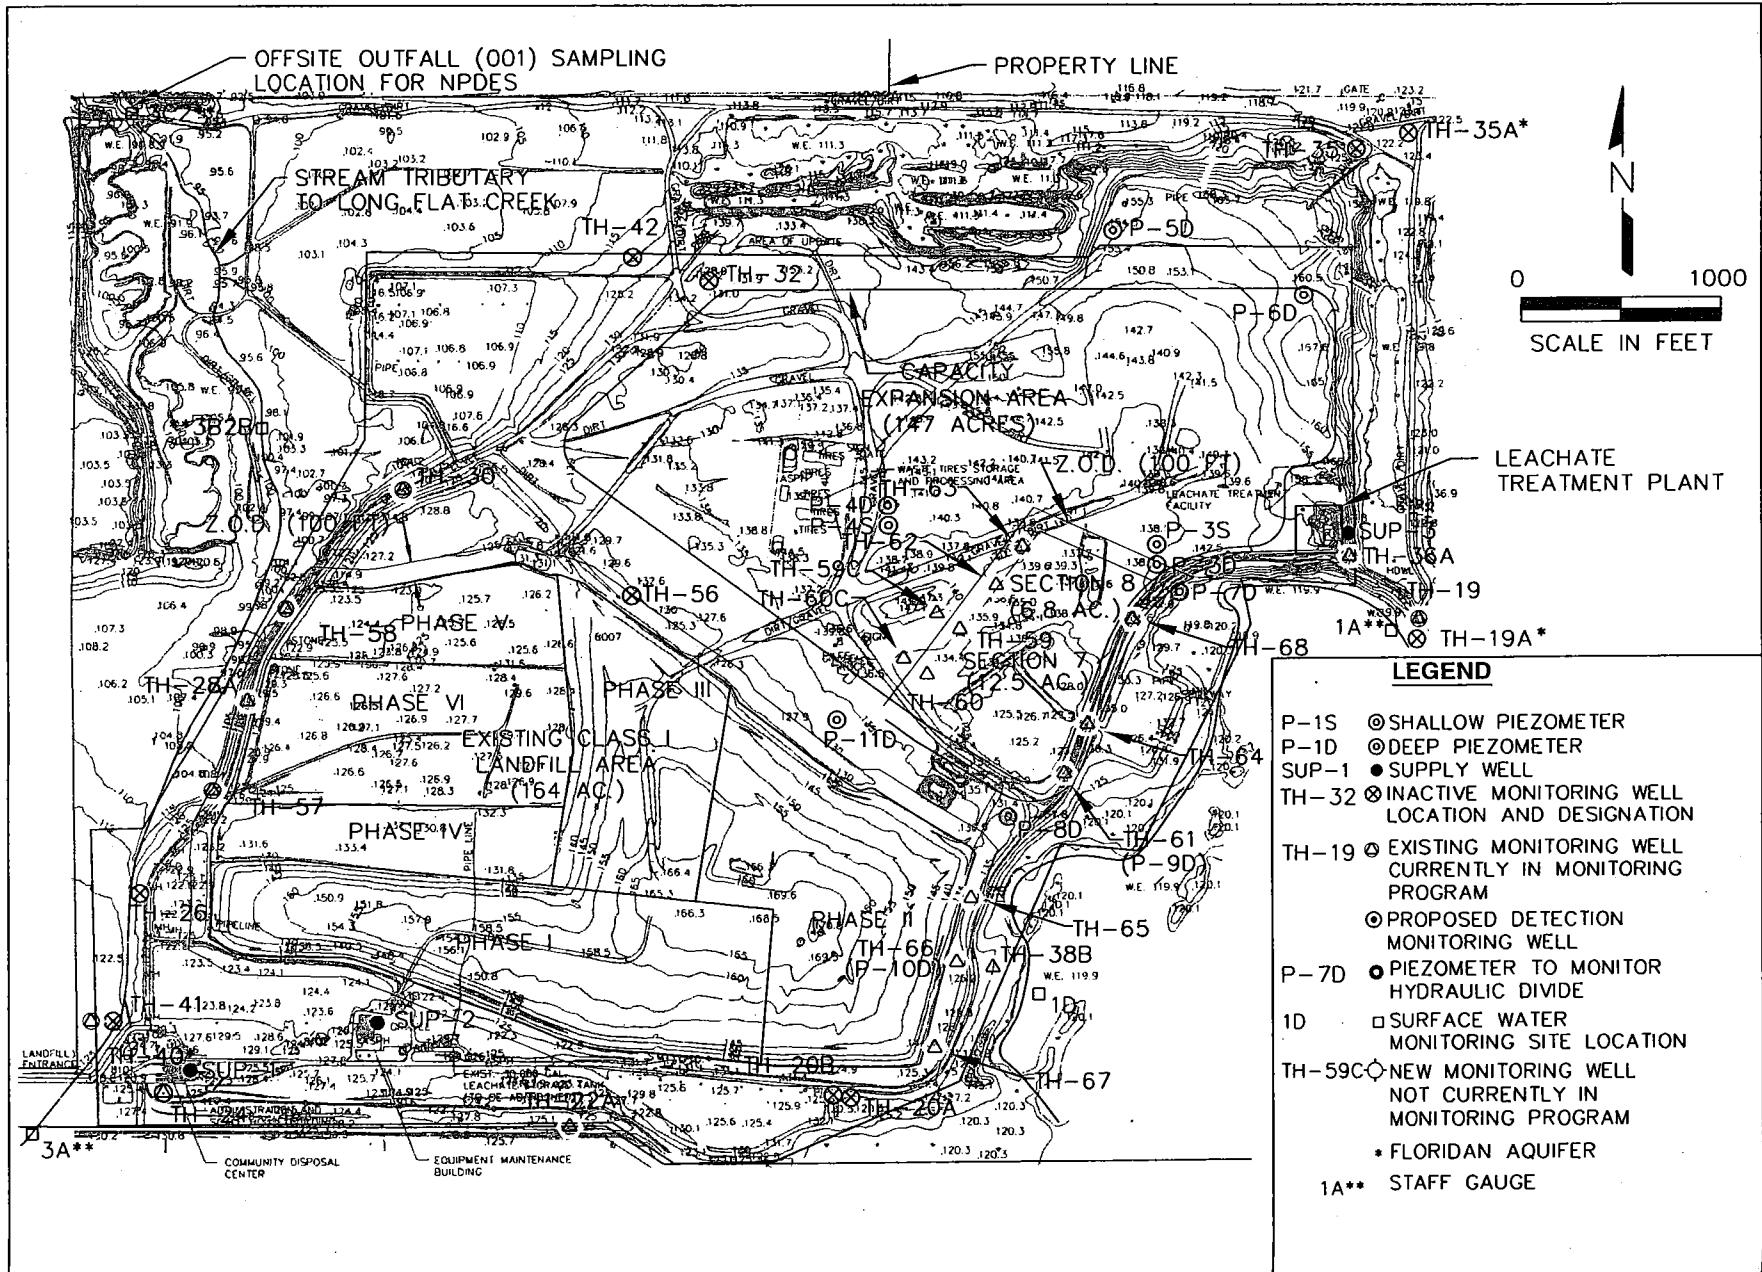

David S. Adams, P.G.

DATA REPORTING QUALIFIERS

Client: Hillsborough County

Job Number: 660-10667-1

<u>Lab Section</u>	<u>Qualifier</u>	<u>Description</u>
GC/MS VOA	U	Indicates that the compound was analyzed for but not detected.
Metals	U	Indicates that the compound was analyzed for but not detected.
	I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
Biology	U	Indicates that the compound was analyzed for but not detected.
	U	Indicates that the compound was analyzed for but not detected.
	I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
