**Re: Southeast County Landfill
Operations Permit No. 35435-006-SO
Semi-Annual Analytical Data Report, August 2005**

Dear Mr. Morris:

In accordance with the Landfill Operation Permits No. 35435-006-SO and 35435-007-SO, the Hillsborough County Solid Waste Management Department (SWMD) is pleased to provide the August 2005 analytical data report (ADR) for the semi-annual water quality monitoring at the Southeast County Landfill (SCLF). Samples were collected on August 22 through August 24 by the SWMD Field Sampling Team.

The SWMD would like to make you aware of some problems we have experienced with our contracted analytical laboratory, Test America, Inc. (TA). Several problems were experienced at the laboratory, and specifically within their metals analysis area. The initial data reported lead and several other metals at concentrations significantly above standards in almost all of the samples, and the historical data set for the site did not support these findings. The SWMD requested that TA re-digest and reanalyze the samples for lead, and after a significant delay, the results appeared more in line with the historical data set. Problems with other parameters that have affected the data set from this event include Antimony, Mercury, and Vinyl Chloride. The problems experienced at the SCLF were also documented at other sites, and the volume and frequency of problems have resulted in the SWMD terminating our contract with TA.

Severn Trent will be performing analysis of our samples for future sampling events at the SCLF. Based on the problems we have documented, the data set from this sampling event contains several outliers, and the SWMD intends evaluate the data set further after the next scheduled sampling event in February 2006. Additionally, we plan to sample and analyze the Section 7 detection wells, TH-59 and Th-60 in November to evaluate the effectiveness of the proposed corrective actions addressing the migration of landfill gas in that area.

Mr. John Morris, P.G.
October 26, 2005
Page 2

The surficial aquifer groundwater monitoring wells continue to exhibit pH values below the Secondary Drinking Water Standard's (SDWS) acceptable range. Iron is consistently observed above the SDWS within several surficial aquifer wells at the SCLF, including the background water quality wells TH-22A and TH-36A. The SWMD maintains the position that the elevated concentrations of iron and the low pH values can be directly attributed to the previous usage of the property as a phosphate mining area.

The two Section 7 detection monitoring wells, TH-59 and TH-60, continue to exhibit impacts from the migration of landfill gas out of the landfill. Additional remedial actions are currently being implemented by the SMWD, and our new engineering consultant, Jones Edmunds, Inc., shall submit the findings in a separate response to the Florida Department of Environmental Protection (FDEP) comment letter dated September 26, 2005.

The violations of the water quality criteria and the overall impact to the future groundwater monitoring activities at the SCLF are discussed in parameter specific details herein.

GENERAL PARAMETERS

pH

The surficial aquifer detection and background groundwater quality monitoring wells continue to exhibit pH values below the SDWS acceptable range of 6.5 to 8.5 pH units. The pH values across the site range in value from 4.70 to 6.22 pH units. The pH at the site has historically been observed to be below the acceptable range. The 1983 Ardaman and Associates, Inc. report titled Hydrogeologic Investigation, Southeast County Landfill, reported pH values ranging from 4.4 to 6.7 pH units in six wells on site. This data was collected prior to construction of the landfill, and therefore demonstrates that the pH values historically observed are directly attributable to the mining activities conducted on site prior to construction of the landfill.

The surface water discharge monitoring point, 3C2, exhibited a value of 6.97 pH units. No unusual conditions or changes in pH values within any of the groundwater monitoring wells or surface water sites were observed during this sampling event.

Total Dissolved Solids

The surficial aquifer detection wells, TH-58, TH-59, and TH-60, exhibits total dissolved solids (TDS) above the Secondary Drinking Water Standard (SDWS) of 500 milligrams per liter (mg/l) with concentrations of 526 mg/l, 756 mg/l, and 1210 mg/l. All the other monitoring wells were observed below the SDWS for TDS during this sampling event.

Mr. John Morris, P.G.
October 26, 2005
Page 3

Radium 226

The Weeks' private supply well exhibited concentrations of radium 226 at 7.8 picocuries per liter (pCi/l), which is above the Primary Drinking Water Standard (PDWS) of 5 pCi/l. This supply well has periodically been observed to exhibit radium 226 slightly above the MCL. No unusual conditions or changes in radium 226 values were observed during this sampling event.

Fecal Coliform

The surface water sampling points, 3A, 3B2B, 3C2, and 1-D (Smith Lake) exhibited concentrations of fecal coliform at 4,200 colonies per 100 milliliter (col/ml), 2,300 col/ml, 4,800 col/ml, and 1,500 col/ml, which is above the Surface Water Standard of 800 col/ml.

METALS

Iron

Iron concentrations in eleven of the thirteen surficial aquifer monitoring wells were above the applicable SDWS of 0.300 mg/l. The highest concentration for iron was 15 mg/l in detection well TH-60. The iron concentrations observed in the surficial aquifer wells across the site have historically been elevated, and the 1983 Ardaman and Associates, Inc. report titled Hydrogeologic Investigation, Southeast County Landfill, reported iron above the PDWS at concentrations ranging from 0.43 to 20.0 milligrams per liter (mg/l). Based on the iron observed in 1983 prior to construction of the landfill, the iron historically observed across the site is directly attributable to the past mining activities. It should be noted that areas at the SELF that have been disturbed by mining or landfill construction activities appear to exhibit the higher iron concentrations.

The SCLF private supply wells owned by Weeks and Holland exhibited levels of iron above the SDWS with concentrations of 0.48 mg/l and 1.5 mg/l, respectively. No unusual conditions or changes in iron concentrations within any of the groundwater monitoring wells or surface water samples at the site were observed during this event.

Nickel

Nickel was observed in TH-60 above the PDWS of 0.1 mg/l at a concentration of 0.158 mg/l, during this sampling event. Detection well TH-59 indicated a level of nickel of 0.0855 mg/l. Nickel has been consistently observed in these wells, and the initial samples, which were collected in October 2003 prior to waste being placed in the Section 7 cell, exhibited nickel above the PDWS.

Mr. John Morris, P.G.
October 26, 2005
Page 4

Antimony

Antimony concentrations in four of the thirteen surficial aquifer monitoring wells and the two florian wells were above the applicable PDWS of 0.006 mg/l. Surficial wells TH-58, TH-59, TH-60, TH-67 and the Floridan wells TH-19 and TH-40 indicated levels of antimony ranging from 0.00712 to 0.0175 mg/l. The SCLF private supply wells owned by Weeks, Holland, and Barnes exhibited levels of antimony also above the PDWS with concentrations of 0.011 mg/l, 0.011 mg/l and 0.00813 mg/l, respectively. These concentrations are well above the PDWS of 0.006 mg/l. Historically, Antimony has been observed below or just above detection limits in these private supply wells, and the results from this event are considered outliers. Additionally, it should be noted that the SWMD has experienced numerous data quality problems with our contracted laboratory, Test America, and specific problems within their metals analysis section have been documented. The reported values are not believed to be representative of water quality within these wells with respect to Antimony, and the November samples will be analyzed by our new contract laboratory, Severn Trent.

Mercury

Mercury concentrations from all four of the surface water sites were above the applicable surface water standard of 0.000012 mg/l. Surface water sites 3A, 3B2B, 3C2, and Smith Lake indicated levels of mercury of 0.0000786 mg/l, 0.0000766 mg/l, 0.0000907 mg/l, and 0.0000857 mg/l. The presence of mercury in the surface water at the SCLF is questionable, and the historical data set indicates mercury has not been present at these sample sites. As previously discussed, the SWMD has been experiencing numerous problems with our contracted laboratory, Test America. Therefore we consider these violations of water quality standards to be outliers.

Turbidity

In accordance with the April 3, 2003 Approval of Corrective Action Plan letter from the Florida Department of Environmental Protection (FDEP), the SWMD has included the recorded turbidity data for the period from March 2005 through August 2005. A summary table of the turbidity data obtained from the surface water sampling points 3A, 3B2B and 3C2 located in Long Flat Creek is provided within this ADR. The turbidity measurements have been within the compliance level of 29 nephelometric turbidity units (NTU) above the background (upstream) level. However, the turbidity recorded on August 22, 2005 at around lunch time during this sampling event indicated a turbidity value of 33 NTU at the discharge point. The upstream value was recorded at 1.9, which is a violation of surface water standards. The on site personnel recorded turbidity readings at around 7:45 a.m. on August 22, 2005 and August 23, 2005, in response to the 2.8 inches of rain fall received on August 21, 2005 and 1.7 inches of rain received on August 22, 2005. These two turbidity recordings bracket the turbidity recording conducted by our Field Sampling Team. Although there was a violation on August 22, the conditions at the discharge point returned to compliance quickly on August 23, and have remained so to date.

Mr. John Morris, P.G.
October 26, 2005
Page 5

The failure to report the violation listed above is a result of the Field Sampling Team not recognizing the discharge point being 29 NTU above the upstream value. In all future semi annual sampling events performed at Long Flat Creek, the Field Sampling Team and the on-site personnel will each record the turbidity values for additional monitoring and instrument calibration quality control. All future reporting of turbidity recorded at the SCLF shall continue to be submitted within each semi-annual ADR, and any violations will be immediately reported.

Fecal Coliform

The results of analysis of samples collected at the four surface water sites exhibited high concentrations of fecal coliform bacteria. The samples were collected on August 22, 2005 by the Field Sampling Team, and at the time of sample collection Long Flat Creek was observed to be flowing over it's banks in several areas along the creek. Water was extending out into the woods along the area just west of the original landfill Phases I – VI. The site had received 2.8 inches of rain on August 21, 2005, and the run off from this significant rainfall event likely drove the high fecal counts in the surface water of the Creek. The upstream point 3A, exhibited 4200 colonies per 100 milliliter (col/ml), the mid-stream point 3B2B exhibited 2500 col/ml, and the discharge point 3C2 exhibited 4800 col/ml. The surface water sampling point in Smith Lake exhibited fecal coliform at 1500 col/ml. The area in the vicinity of this sampling location is frequently utilized as a roosting area by the numerous birds that are attracted to the landfill, and fecal coliform is regularly observed in the samples collected.

ORGANIC PARAMETERS

The organic parameters tested under EPA Method 8260 were sampled between August 22 through August 24, 2005. The results are discussed in detail in the following paragraphs.

Volatile Organic Parameters

Benzene was observed in TH-60 above the PDWS of 1 microgram per liter (ug/l) at a concentration of 5.08 ug/l, respectively. The chlorinated solvents methylene chloride, chloroethane, cis-1,2-dichloroethane, 1,2 dichloroethane, 1,1-dichloroethane, and vinyl chloride were observed in TH-60, and cis-1,2-dichloroethane, 1,1-dichloroethane, and vinyl chloride were observed in TH-59. These detections of chlorinated solvents except for vinyl chloride were observed below their respective drinking water standards or guidance concentrations.

Vinyl chloride was detected in surficial monitoring wells TH-59 and TH-60 during this sampling event with levels of 20.9 ug/l and 26.9 ug/l, respectively. These observations were well above the PDWS of 1 ug/l. Historically, these wells have never detected vinyl chloride at or above the PDWS, and the SWMD questioned the data provided by Test America.

Mr. John Morris, P.G.
October 26, 2005
Page 6

Based on an evaluation of the data set for these two wells, the SWMD performed a separate sampling event for TH-59 and TH-60 on September 8, 2005 to determine if vinyl chloride was present. Along with the SWMD, SCS Engineers collected duplicate or split samples from these two wells. Samples collected by the SWMD were delivered to Test America, Inc. in Orlando, Florida. SCS Engineers delivered their analysis to Environmental Science Corp. (ESC) in Mount Juliet, Tennessee. ESC laboratory is state-certified and qualified to complete the analysis. Laboratory analysis from the sample collected by the SWMD indicated vinyl chloride was detected in TH-59 and TH-60 at concentrations of 22.7 mg/l and 25.5 mg/l, which exceeds the PDWS of 1 ug/l. However, the analysis collected by SCS Engineers and analyzed by ESC did not detect any vinyl chloride in their samples. The large differences in this and other analytical data lead the SWMD to question the validity of the data provided by Test America, Inc. The SWMD considers the vinyl chloride reported by Test America to be outliers, and this position is supported by the historical data and the split samples collected by SCS and analyzed by ESC.

Enclosed for your review is a detailed site location map, the analytical data summary tables, a groundwater elevation data summary table, a surficial aquifer groundwater elevation contour diagram, a data summary table of turbidity measurements, a data summary table for the private supply wells, copies of the letters sent to the owners of the private wells, and the complete laboratory analytical data report sheets.

The SWMD apologizes for the delay in submittal of this ADR, and the numerous problems associated with the analysis of samples. However, we are confident that the problems have been or in the process of being resolved, and the project is back on track. Should you have any questions, require any additional information, or would like to discuss the information provided within this submittal, please feel free to contact me at (813) 276-2944 or via e-mail at adamsds@hillsboroughcounty.org.

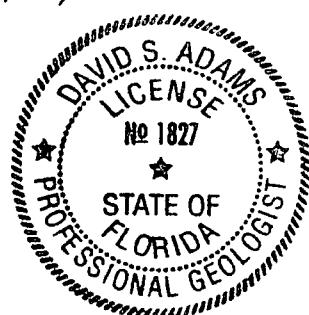

Sincerely,

Lithia, FL 33547

Subject: Analytical Data
Domestic Supply Well
116 Wendel Ave.

Dear Mr. & Mrs. Weeks:

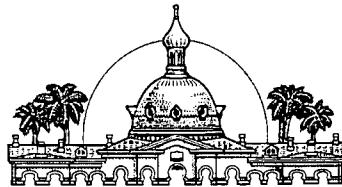

The Hillsborough County Solid Waste Management Department (SWMD) is pleased to provide the analytical data for your domestic supply well which was sampled on August 22, 2005. Antimony and Iron were observed at concentrations of 0.011 mg/l and 0.397 mg/l, respectively. These values exceed the Florida Primary and Secondary Drinking Water Standard (FAC Ch 62-550.310-320) of 0.006 mg/l and 0.30 mg/l. The SWMD's contract laboratory experienced equipment problems with their metals analysis. After reviewing the historical sample data for this well, the SWMD believes that the Antimony result is not an accurate representation of the water quality conditions and is considered an outlier. The SWMD will be sampling this well during the month of November and will be utilizing a new contracted laboratory for the analysis. Radium 226 was also observed at a concentration of 7.8 pCi/l which exceeds the Florida Primary Drinking Water Standard of 5.0 pCi/l. All other parameters tested are within Florida Primary and Secondary Drinking Water Standards (FAC Ch 62-550.310-.320).

For health effects information you may call the Hillsborough Health Department at (813) 307-8001. If you have any questions on the analysis, you may call me at 276-2955. Thank you for your permission to test this well.

Sincerely,

A handwritten signature in black ink, appearing to read "Michael D. Townsel".

Subcontracted Laboratories

Florida Radiochemistry Services Inc. Florida Cert #E83033, North Carolina Cert #12709, South Carolina Cert #96037001, Tennessee Cert ##02928

5456 Hoffner Road Suite 201 - Orlando, FLORIDA 32812

Method Performed: EPA 900.0

Samples: OOH0395-01, OOH0395-02, OOH0395-03, OOH0395-04

Method Performed: EPA 903.1

Samples: OOH0395-01, OOH0395-02, OOH0395-03, OOH0395-04

Method Performed: Ra-05

Samples: OOH0395-01, OOH0395-02, OOH0395-03, OOH0395-04

DATA QUALIFIERS AND DEFINITIONS

I The reported value is between the laboratory method detection limit and method reporting limit.

J1 Surrogate recovery limits have been exceeded.

J4 The sample matrix interfered with the ability to make an accurate determination.

U The compound was analyzed for but not detected

V The analyte was detected in both the sample and the associated method blank.

ADDITIONAL COMMENTS

When insufficient sample volume is received for Matrix Spike and Matrix Spike Duplicate, Laboratory Control Spike and Laboratory Control Spike Duplicate data is used for batch QC.
