

The inventory table shows the mode of transportation for each waste group of the expected maximum number of drums at the time of closure. The number of trips the transport vehicle needs to make to haul the total inventory amount of a waste type is obtained by dividing the number of drums of the waste by the load size of the transport vehicle (i.e., 86 drums) used to ship the waste off-site. All containers in inventory at closure will be shipped off-site using trucks. See inventory table - II.K.1.g-1a.
