Item No. 1.7:

Water quality report is reviewed as a separate function and is not deemed part of this inspection report.

Leachate holding ponds are lined and covered. At the time of the inspection, a significant amount of gas build-up was under the covers creating a 'bubble' effect. Matthew Orr explained that the

Inspection Date: 09/01/2009

'bubble' is a result of the final cover being installed on the closed section of landfill area thus allowing for some gas to travel more readily with the leachate into the holding pond. The plan to address this issue is to install 'tiki torch' gas wells at leachate collection areas in order to burn off the gas which is being collected in the leachate system.

JED practices "close as you go" techniques. The recently closed areas of the landfill are experiencing minor erosion above the final cover due to rain events happening before the sod layer could take hold. These areas are sodded and are above the final cover. The plan to address the erosion is to wait until the rainy season is over (3-5 weeks) and address all erosion areas.

When available, JED uses auto fluff as daily cover. An alternative recycling effort is being investigated to further process the auto fluff on site prior to use as cover. The recycling would involve mechanically removing the remaining metal products within the auto fluff and selling the recyclable metals. The remaining material (auto fluff) would then be used as cover. JED is working closely with DEP to properly permit this activity.
